“Detection and Mapping of Branched Wiring Networks from Reflectometry
Responses,” Joint FAA/DoD/NASA Conference on Aging Aircraft, Palm Springs,
CA, Jan 31-Feb 4, 2005

Abstract:

Reflectometry methods including time, frequency, sequence, and spread spectrum reflectometry methods are capable of providing highly accurate location of faults on aircraft wiring. One of the significant challenges in applying these methods in practice is that many wires, particularly power wires, branch into tree-shaped networks from which multiple reflections create extremely difficult-to-interpret reflectometry responses. In this presentation, we will discuss the complexity of the branched network problem and why accurate measurements of the length and magnitude are so critical for solving this problem. We will also introduce two functional novel systematic approaches to solve this problem, which do not require prior measurements as baselines. Additionally, we will present results from our approaches with both simulated and measured reflectometry data of branched networks. Sources of error including measurement error and topology ambiguity are considered, and an assessment of network mapping strategies is given for both ideal and nonideal data.

Impulse Response Shows Magnitude and Delay of Each Reflection

Typical Branched Network Has Many SMALL Reflections

Noise Masks Small Reflections

What About FRAYS and ARCS?

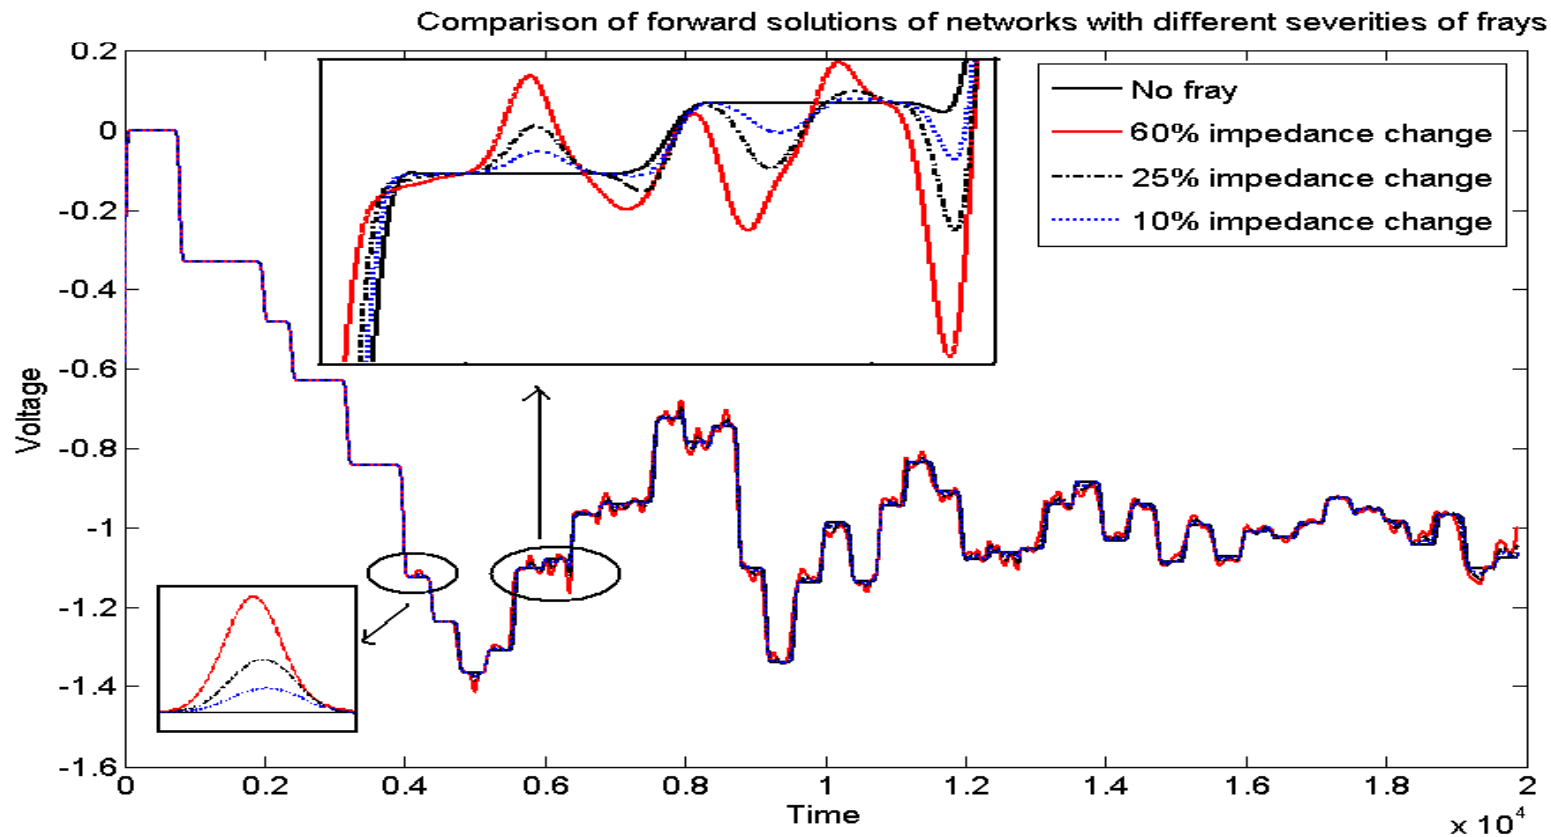

Fray on a Network

All the lines have characteristic impedance $Z_0 = 50$ ohms.

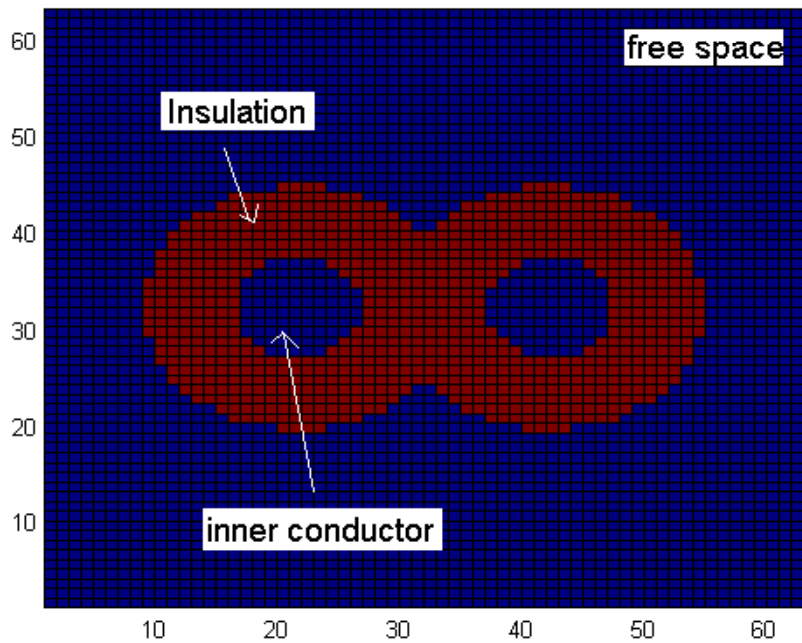

The lines are terminated by shorted ends.

Reflectometry Response

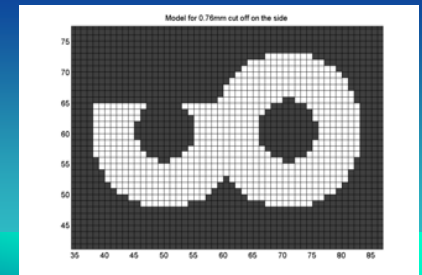

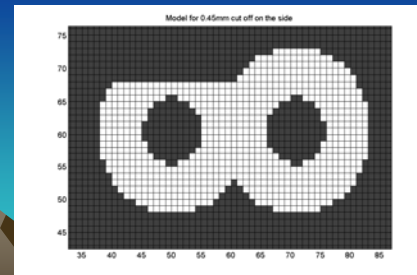

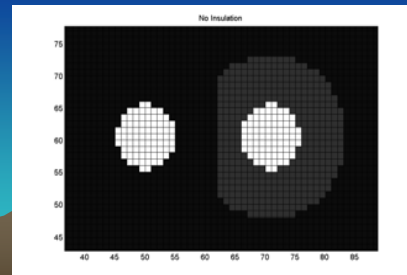

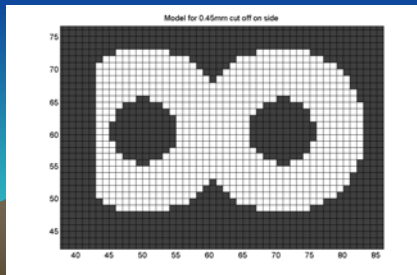

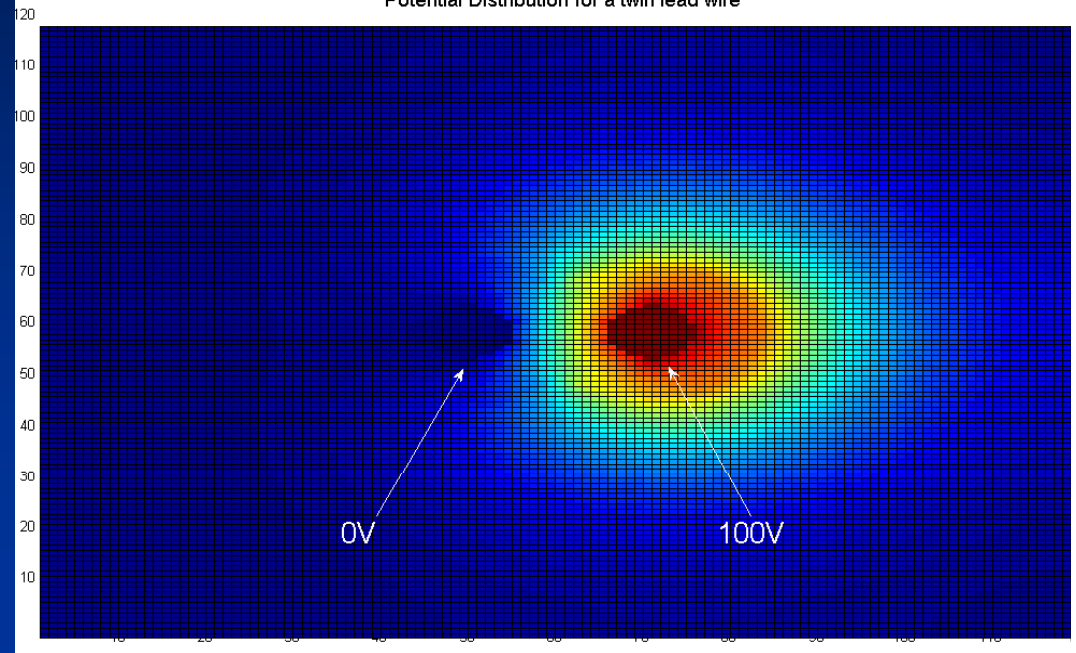

Simulated Frays

Cross-section of a two wire line

Potential Distribution for a twin lead wire

Fray impedances and reflection coefficients

	Scenario	Characteristic Impedance (Ω)	Reflection Coefficient
1	Short Circuit		-100 %
2	Open Circuit		100 %
3	No changes	77.57	0
4	Water Drop	73.81	-2.4 %
5	Cut .15 mm off top	77.59	0.014%
6	Cut .45 mm off top	77.64	0.044%
7	Cut .76 mm off top	78.01	0.28%
8	Cut .15 mm off side	77.57	0.0021%
9	Cut .45 mm off side	77.58	0.0056%
10	Cut .76 mm off side	77.60	0.017%

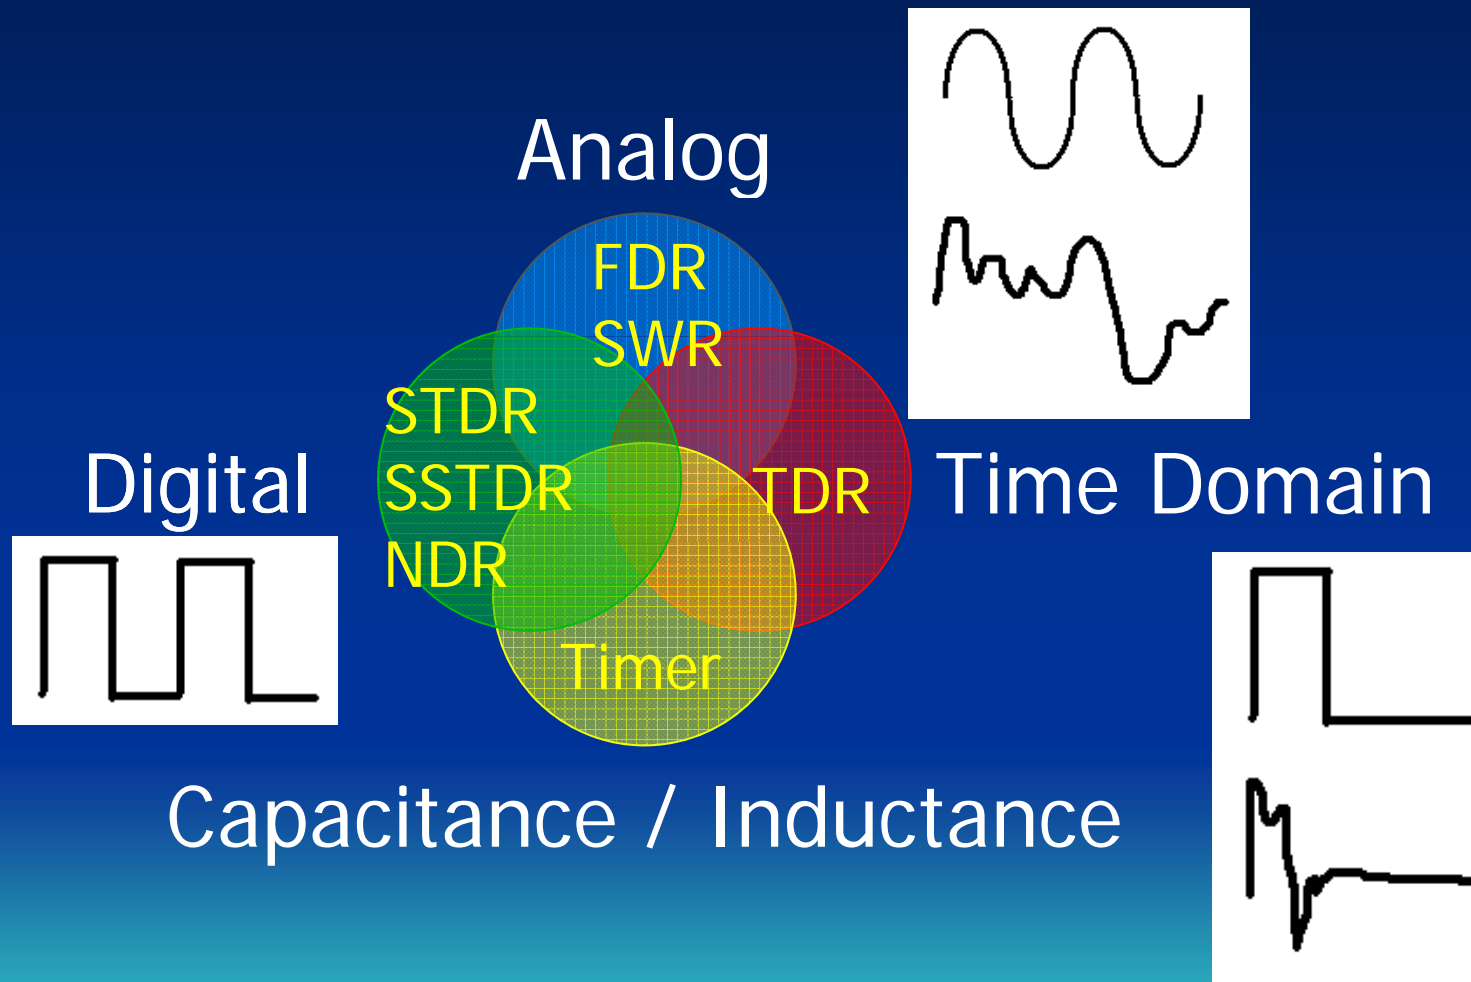

Fray Impedance is Similar to Normal Impedance Variation on UnControlled Impedance Wire

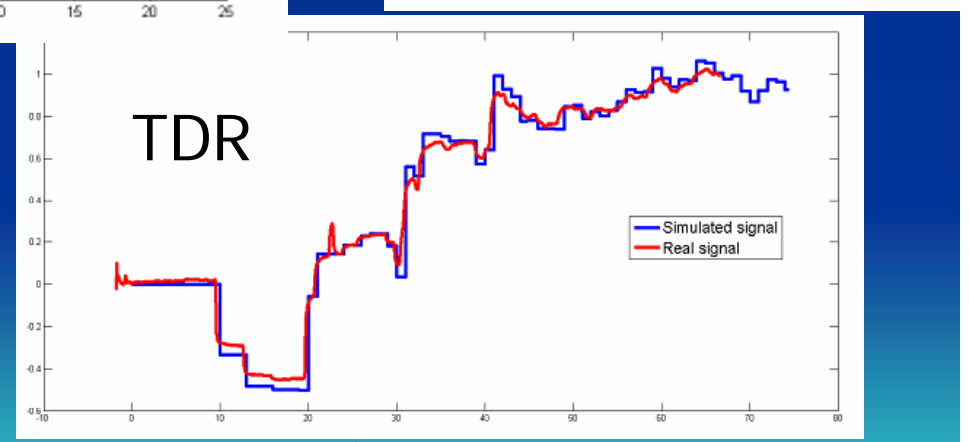

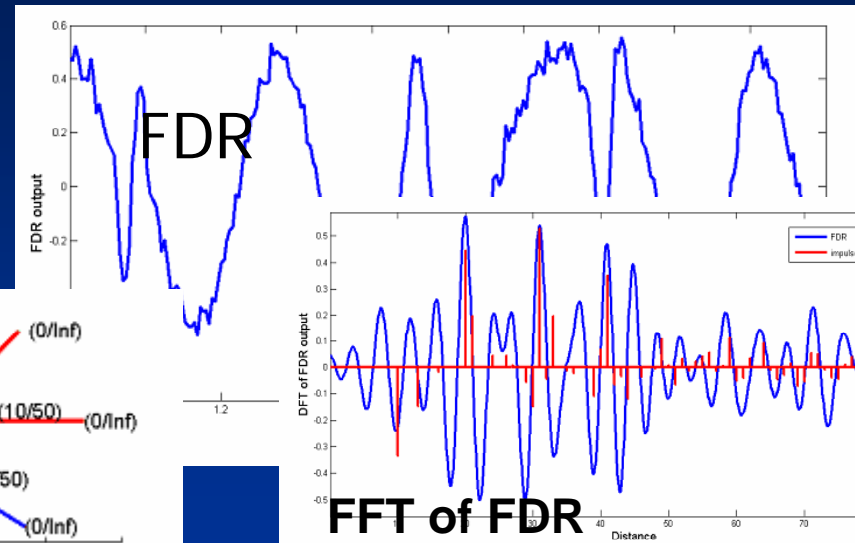

Frays are “Invisible” to Reflectometry

Run “Live” to Locate Intermittent OPEN or SHORT Instead
