ECE 2210   Lecture 18 notes   Second order Transient examples
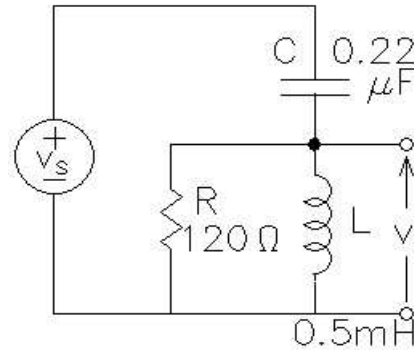

Ex. 1 For the circuit shown:

a) Find the transfer function v_L.

$$V_L(s) = \frac{\dfrac{1}{\dfrac{1}{L \cdot s} + \dfrac{1}{R}}}{\dfrac{1}{\dfrac{1}{L \cdot s} + \dfrac{1}{R}} + \dfrac{1}{C \cdot s}} \cdot V_S(s)$$

$$= \frac{1}{1 + \dfrac{1}{C \cdot s} \cdot \left(\dfrac{1}{L \cdot s} + \dfrac{1}{R}\right)} \cdot V_S(s) \qquad = \frac{1}{1 + \dfrac{1}{C \cdot s} \cdot \dfrac{1}{L \cdot s} + \dfrac{1}{C \cdot s} \cdot \dfrac{1}{R}} \cdot V_S(s) \qquad = \frac{s^2}{s^2 + \dfrac{1}{C \cdot R} \cdot s + \dfrac{1}{L \cdot C}} \cdot V_S(s)$$

$$H(s) = \frac{V_L(s)}{V_S(s)} = \frac{s^2}{s^2 + \dfrac{1}{C \cdot R} \cdot s + \dfrac{1}{L \cdot C}}$$

$$= \frac{s^2}{s^2 + \dfrac{3.788 \cdot 10^4}{\text{sec}} \cdot s + \dfrac{9.091 \cdot 10^9}{\text{sec}^2}}$$

$R := 120 \cdot \Omega \qquad C := 0.22 \cdot \mu F \qquad L := 0.5 \cdot mH$

$\dfrac{1}{C \cdot R} = 3.788 \cdot 10^4 \cdot \dfrac{1}{\text{sec}} \qquad \dfrac{1}{L \cdot C} = 9.091 \cdot 10^9 \cdot \dfrac{1}{\text{sec}^2}$

b) Find the characteristic equation for this circuit.

$$0 = s^2 + \frac{1}{C \cdot R} \cdot s + \frac{1}{L \cdot C} = s^2 + \frac{3.788 \cdot 10^4}{\text{sec}} \cdot s + \frac{9.091 \cdot 10^9}{\text{sec}^2}$$

Just the denominator set to zero. The solutions of the characteristic equation are the "poles" of the transfer function.

c) Find the differential equation for v_L.

Cross-multiply the transfer function

$$s^2 \cdot V_S(s) = \left(s^2 + \frac{1}{C \cdot R} \cdot s + \frac{1}{L \cdot C}\right) \cdot V_L(s)$$

$$s^2 \cdot V_S(s) = s^2 \cdot V_L(s) + \frac{1}{C \cdot R} \cdot s \cdot V_L(s) + \frac{1}{L \cdot C} \cdot V_L(s)$$

$$\frac{d^2}{d t^2} v_S(t) = \frac{d^2}{d t^2} v_L(t) + \frac{1}{C \cdot R} \cdot \frac{d}{dt} v_L(t) + \frac{1}{L \cdot C} \cdot v_L(t)$$

$$\frac{d^2}{d t^2} v_S(t) = \frac{d^2}{d t^2} v_L(t) + \frac{3.788 \cdot 10^4}{\text{sec}} \cdot \frac{d}{dt} v_L(t) + \frac{9.091 \cdot 10^9}{\text{sec}^2} \cdot v_L(t)$$

d) What are the solutions to the characteristic equation?

$$s_1 = \frac{-3.788 \cdot 10^4}{2} + \frac{1}{2} \cdot \sqrt{\left(3.788 \cdot 10^4\right)^2 - 4 \cdot \left(9.091 \cdot 10^9\right)} = -1.894 \cdot 10^4 + 9.345 \cdot 10^4 j$$

$$s_2 = \frac{-3.788 \cdot 10^4}{2} - \frac{1}{2} \cdot \sqrt{\left(3.788 \cdot 10^4\right)^2 - 4 \cdot \left(9.091 \cdot 10^9\right)} = -1.894 \cdot 10^4 - 9.345 \cdot 10^4 j$$
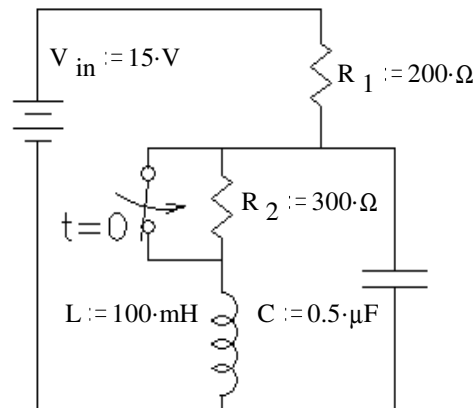

e) What type of response do you expect from this circuit?   The solutions to the characteristic equation are complex so the response will be **underdamped**.

ECE 2210   Lecture 18 notes p1

Ex. 2   Analysis of the circuit shown yields the characteristic equation below. The switch has been in the open position for a long time and is closed (as shown) at time $t = 0$. Find the initial and final conditions and write the full expression for $i_L(t)$, including all the constants that you find.

$$s^2 + \left(\frac{1}{C \cdot R_1}\right) \cdot s + \left(\frac{1}{L \cdot C}\right) = 0$$

$V_{in} := 15 \cdot V$ $R_1 := 200 \cdot \Omega$

$R_2 := 300 \cdot \Omega$

$t = 0$

$L := 100 \cdot mH$ $C := 0.5 \cdot \mu F$

$$\left(\frac{1}{C \cdot R_1}\right) = 1 \cdot 10^4 \; \cdot \frac{1}{sec} \qquad\qquad \left(\frac{1}{L \cdot C}\right) = 2 \cdot 10^7 \; \cdot \frac{1}{sec^2}$$

$$s^2 + 10000 \cdot \frac{1}{sec} \cdot s + 2 \cdot 10^7 \cdot \frac{1}{sec^2} = 0$$

$$s_1 := \left[\frac{-10000}{2} + \frac{1}{2} \cdot \sqrt{(10000)^2 - 4 \cdot (2 \cdot 10^7)}\right] \cdot sec^{-1} \qquad s_2 := \left[\frac{-10000}{2} - \frac{1}{2} \cdot \sqrt{(10000)^2 - 4 \cdot (2 \cdot 10^7)}\right] \cdot sec^{-1}$$
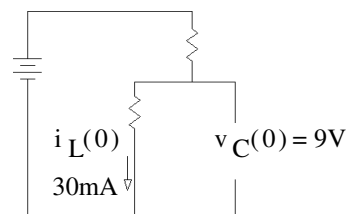

$$s_1 = -2764 \cdot sec^{-1} \qquad\qquad\qquad s_2 = -7236 \cdot sec^{-1} \qquad s_1 \text{ and } s_2 \text{ are both real and distinct, overdamped}$$

Find the initial conditions:

Before the switch closed, the inductor current was: $\dfrac{15 \cdot V}{R_1 + R_2} = 30 \cdot mA = i_L(0)$

Before the switch closed, the capacitor voltage was: $\dfrac{R_2}{R_1 + R_2} \cdot (15 \cdot V) = 9 \cdot V = v_C(0)$

$i_L(0)$ $v_C(0) = 9V$

$30mA$

When the switch is closed, the inductor is suddenly in parallel with the capacitor, and:

$$v_L(0) = v_C(0)$$

$$\frac{d}{dt} i_L(0) = \frac{1}{L} \cdot v_L(0) =$$

$$\frac{1}{L} \cdot 9 \cdot V = 90 \cdot \frac{A}{sec}$$

$t = 0$ $v_C(0)$

$i_L(0)$ $v_L(0)$

Find the final condition:

$$i_L(\infty) =$$

$$\frac{15 \cdot V}{R_1} = 75 \cdot mA$$

$i_L(\infty)$ $v_C(\infty) = 0V$

General solution for the overdamped condition: $i_L(t) = i_L(\infty) + B \cdot e^{s_1 t} + D \cdot e^{s_2 t}$

Initial conditions: $i_L(0) = \dfrac{15 \cdot V}{R_1 + R_2} = i_L(\infty) + B + D$, so $B = i_L(0) - i_L(\infty) - D = 30 \cdot mA - 75 \cdot mA - D$

$$= -45 \cdot mA - D$$

$$\frac{d}{dt} i_L(0) = 90 \cdot \frac{A}{sec} = s_1 \cdot B + s_2 \cdot D = s_1 \cdot (-45 \cdot mA - D) + s_2 \cdot D = s_1 \cdot (-45 \cdot mA) - s_1 \cdot D + s_2 \cdot D$$
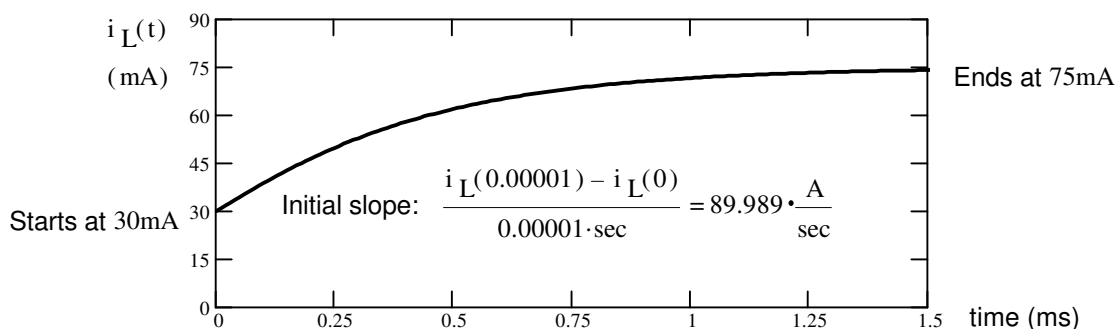

solve for D & B: $D := \dfrac{90 \cdot \dfrac{A}{sec} - s_1 \cdot (-45 \cdot mA)}{-s_1 + s_2}$ $D = 7.69 \cdot mA$ $B := -45 \cdot mA - D$ $B = -52.7 \cdot mA$

Plug numbers back in: $i_L(t) := 75 \cdot mA - 52.7 \cdot mA \cdot e^{-2764 t} + 7.69 \cdot mA \cdot e^{-7236 t}$

$i_L(t)$
(mA)

Starts at 30mA

Ends at 75mA

Initial slope: $\dfrac{i_L(0.00001) - i_L(0)}{0.00001 \cdot sec} = 89.989 \cdot \dfrac{A}{sec}$

time (ms)

Analysis of the circuit shown yields the characteristic equation and s values below. The switch has been in the closed position for a long time and is opened (as shown) at time $t = 0$. Find the initial and final conditions and write the full expression for $v_C(t)$, including all the constants.
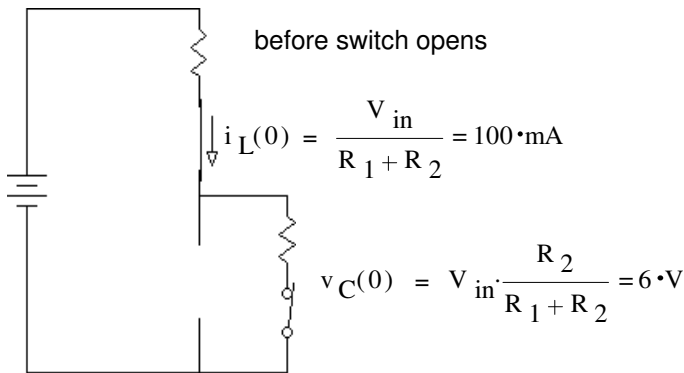

$$0 = s^2 + \frac{R_1}{L} \cdot s + \frac{1}{L \cdot C}$$

$$s_1 := \left(-250 + 10^4 \cdot j\right) \cdot \frac{1}{\sec} \quad , \qquad s_2 := \left(-250 - 10^4 \cdot j\right) \cdot \frac{1}{\sec}$$

$R_1 := 40 \cdot \Omega$

$L := 80 \cdot mH$

$V_{in} := 10 \cdot V$
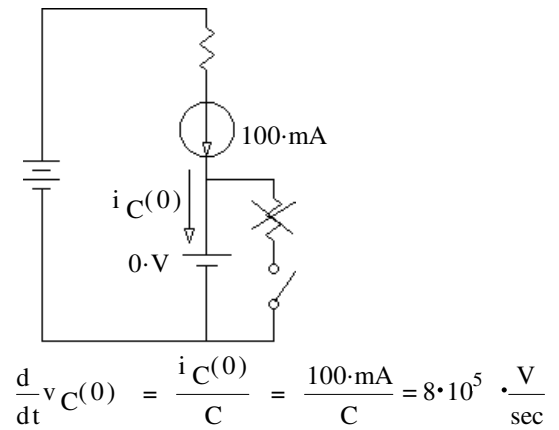

$R_2 := 60 \cdot \Omega$

$C := 0.125 \cdot \mu F$

$t = 0$

Solution: $\alpha := -250 \cdot \dfrac{1}{\sec}$ $\omega := 10000 \cdot \dfrac{rad}{\sec}$

Initial conditions:

before switch opens

$$i_L(0) = \frac{V_{in}}{R_1 + R_2} = 100 \cdot mA$$

$$v_C(0) = V_{in} \cdot \frac{R_2}{R_1 + R_2} = 6 \cdot V$$

just after the switch opens

$100 \cdot mA$

$i_C(0)$

$0 \cdot V$

$$\frac{d}{dt} v_C(0) = \frac{i_C(0)}{C} = \frac{100 \cdot mA}{C} = 8 \cdot 10^5 \cdot \frac{V}{\sec}$$

Find final condition:

$0 \cdot mA$

$10 \cdot V$

$$v_C(\infty) = V_{in} = 10 \cdot V$$
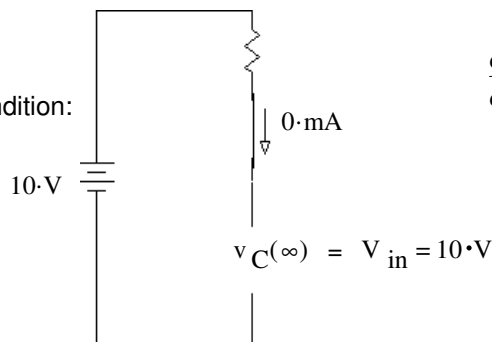

Find constants: $v_C(0) = v_C(\infty) + B$ $B = v_C(0) - v_C(\infty)$ $B := 6 \cdot V - 10 \cdot V$ $B = -4 \cdot V$

$$\frac{d}{dt} v_C(0) = \alpha \cdot B + D \cdot \omega \qquad\qquad D := \frac{8 \cdot 10^5 \cdot \frac{V}{\sec} - \alpha \cdot B}{\omega} \qquad D = 79.9 \cdot V$$

Write the full expression for $v_C(t)$, $v_C(t) = e^{\alpha \cdot t} \cdot (B \cdot \cos(\omega \cdot t) + D \cdot \sin(\omega \cdot t)) + v_C(\infty)$
including all the constants that you find.

$$v_C(t) := e^{-250 \, t} \cdot \left(-4 \cdot V \cdot \cos\left(10^4 \cdot t\right) + 79.9 \cdot V \cdot \sin\left(10^4 \cdot t\right)\right) + 10 \cdot V$$

$\sqrt{D^2 + B^2} = 80 \cdot V$ $v_C(t)$ (volts)

$10 + 80 \cdot e^{-250 \, t}$

$10 - 80 \cdot e^{-250 \, t}$

time (ms)
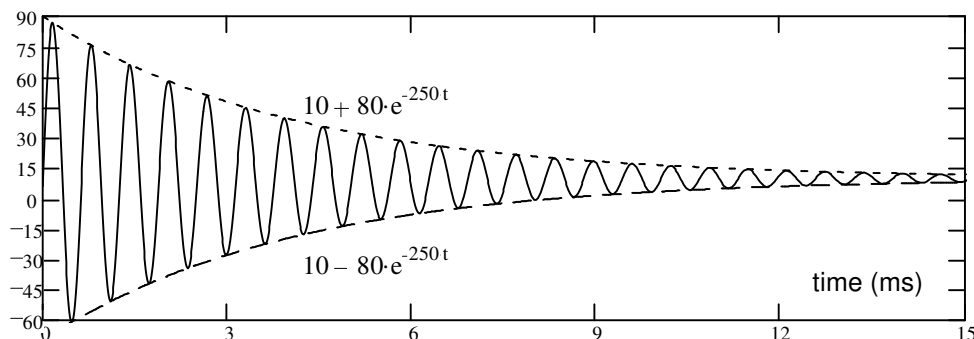

**Ex. 4**   Ex.3 Backwards, switch closes at $t = 0$

Characteristic eq.: $0 = s^2 + \left(\dfrac{1}{C \cdot R_2} + \dfrac{R_1}{L}\right) \cdot s + \left(1 + \dfrac{R_1}{R_2}\right) \cdot \dfrac{1}{L \cdot C}$

$s_1 := -1.257 \cdot 10^3 \cdot \dfrac{1}{sec}$ $s_2 := -1.326 \cdot 10^5 \cdot \dfrac{1}{sec}$

$R_1 := 40 \cdot \Omega$

$L := 80 \cdot mH$

$V_{in} := 10 \cdot V$

$R_2 := 60 \cdot \Omega$

$C := 0.125 \cdot \mu F$

$t = 0$

Initial conditions, same as Ex.3 final:

$10 \cdot V$ $0 \cdot mA$

$v_C(0) = V_{in} = 10 \cdot V$

Find final condition:

just after the switch opens

before switch opens

$0 \cdot V$

$0 \cdot mA$ $0 \cdot V$

$10 \cdot V$

$166.7 \cdot mA$ $10 \cdot V$

$10 \cdot V$

$\dfrac{10 \cdot V}{R_2} = 166.7 \cdot mA$

$i_L(\infty) = \dfrac{V_{in}}{R_1 + R_2} = 100 \cdot mA$

$v_C(\infty) = V_{in} \cdot \dfrac{R_2}{R_1 + R_2} = 6 \cdot V$

$\dfrac{d}{dt} v_C(0) = \dfrac{i_C(0)}{C} = \dfrac{-166.7 \cdot mA}{C} = -1.334 \cdot 10^6 \cdot \dfrac{V}{sec}$
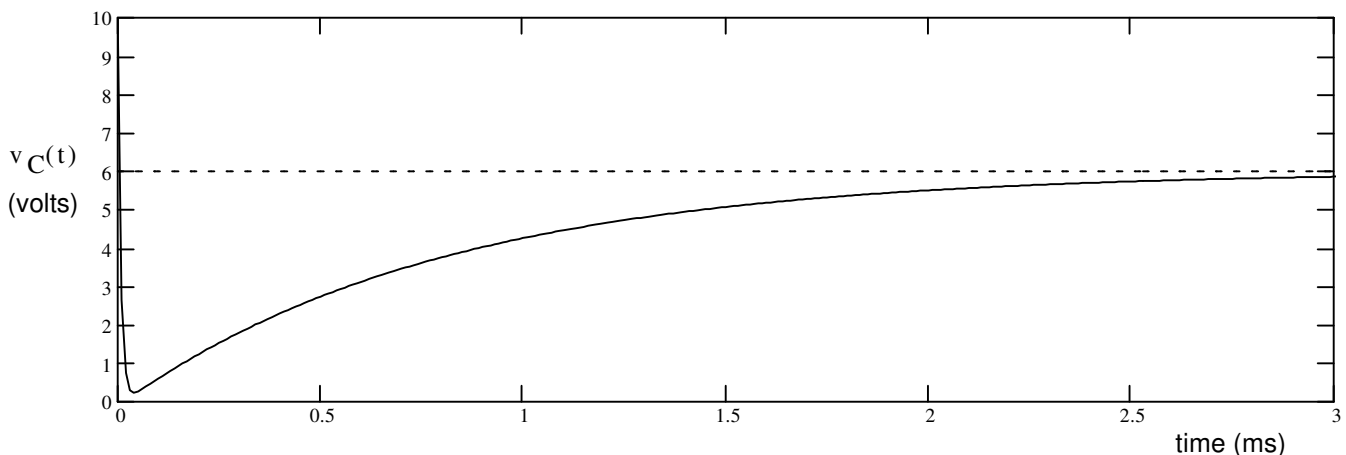

Find constants: $v_C(0) = v_C(\infty) + B + D$, so $B = v_C(0) - v_C(\infty) - D = 10 \cdot V - 6 \cdot V - D = 4 \cdot V - D$

$\dfrac{d}{dt} v_C(0) = -1.334 \cdot 10^6 \cdot \dfrac{V}{sec} = s_1 \cdot B + s_2 \cdot D = s_1 \cdot (4 \cdot V - D) + s_2 \cdot D = s_1 \cdot (4 \cdot V) - s_1 \cdot D + s_2 \cdot D$

$D := \dfrac{-1.334 \cdot 10^6 \cdot \dfrac{V}{sec} - s_1 \cdot (4 \cdot V)}{-s_1 + s_2}$ $D = 10.12 \cdot V$ $B := 4 \cdot V - D$ $B = -6.12 \cdot V$

$v_C(t) := 6 \cdot V - 6.12 \cdot V \cdot e^{-1257 t} + 10.12 \cdot V \cdot e^{-132600 \cdot t}$

$v_C(t)$ (volts) vs time (ms)

Ex. 5 Analysis of a circuit (not pictured) yields the characteristic equation below.

$$0 \; = \; s^2 + 400 \cdot s + 400000 \qquad\qquad R := 80 \cdot \Omega \qquad L := 20 \cdot mH \qquad C := 2 \cdot \mu F$$

Further analysis yields the followiing initial and final conditions:

$$i_L(0) \; = \; 120 \cdot mA \qquad v_L(0) \; = \; -3 \cdot V \qquad\qquad v_C(0) \; = \; 7 \cdot V \qquad\qquad i_C(0) \; = \; -80 \cdot mA$$

$$i_L(\infty) \; = \; 800 \cdot mA \qquad v_L(\infty) \; = \; 0 \cdot V \qquad\qquad v_C(\infty) \; = \; 12 \cdot V \qquad\qquad i_C(\infty) \; = \; 0 \cdot mA$$

Write the full expression for $i_L(t)$, including all the constants that you find. $\qquad i_L(t) \; = ?$

Solution:

$$\frac{400}{2} = 200 \qquad\qquad \frac{\sqrt{400^2 - 4 \cdot 400000}}{2} = 600j$$

$$s_1 := (-200 + 600 \cdot j) \cdot \frac{1}{sec} \qquad and \qquad s_2 := (-200 - 600 \cdot j) \cdot \frac{1}{sec}$$

$$\alpha := Re(s_1) \qquad \alpha = -200 \cdot sec^{-1} \qquad\qquad \omega := Im(s_1) \qquad \omega = 600 \cdot sec^{-1}$$

Initial slope: $\qquad\qquad \dfrac{d}{dt} i_L(0) \; = \; \dfrac{v_L(0)}{L} \; = \; \dfrac{-3 \cdot V}{L} = -150 \cdot \dfrac{A}{sec}$

General solution for the underdamped condition: $\; i_L(t) \; = \; i_L(\infty) + e^{\alpha t} \cdot (B \cdot \cos(\omega \cdot t) + D \cdot \sin(\omega \cdot t))$

Find constants: $\qquad i_L(0) \; = \; i_L(\infty) + B \qquad\qquad B \; = \; i_L(0) - i_L(\infty) \qquad\qquad B := 120 \cdot mA - 800 \cdot mA$

$$B = -680 \cdot mA$$

$$\dfrac{d}{dt} i_L(0) \; = \; \alpha \cdot B + D \cdot \omega \qquad\qquad D := \dfrac{-150 \cdot \dfrac{A}{sec} - \alpha \cdot B}{\omega} \qquad\qquad D = -476.667 \cdot mA$$

Write the full expression for $i_L(t)$, including all the constants that you find.

$$i_L(t) := 800 \cdot mA + e^{-200t} \cdot (-680 \cdot mA \cdot \cos(600 \cdot t) - 477 \cdot mA \cdot \sin(600 \cdot t))$$

$800 \cdot mA \cdot \left(1 - e^{-200t}\right)$

$800 \cdot mA$

time (ms)
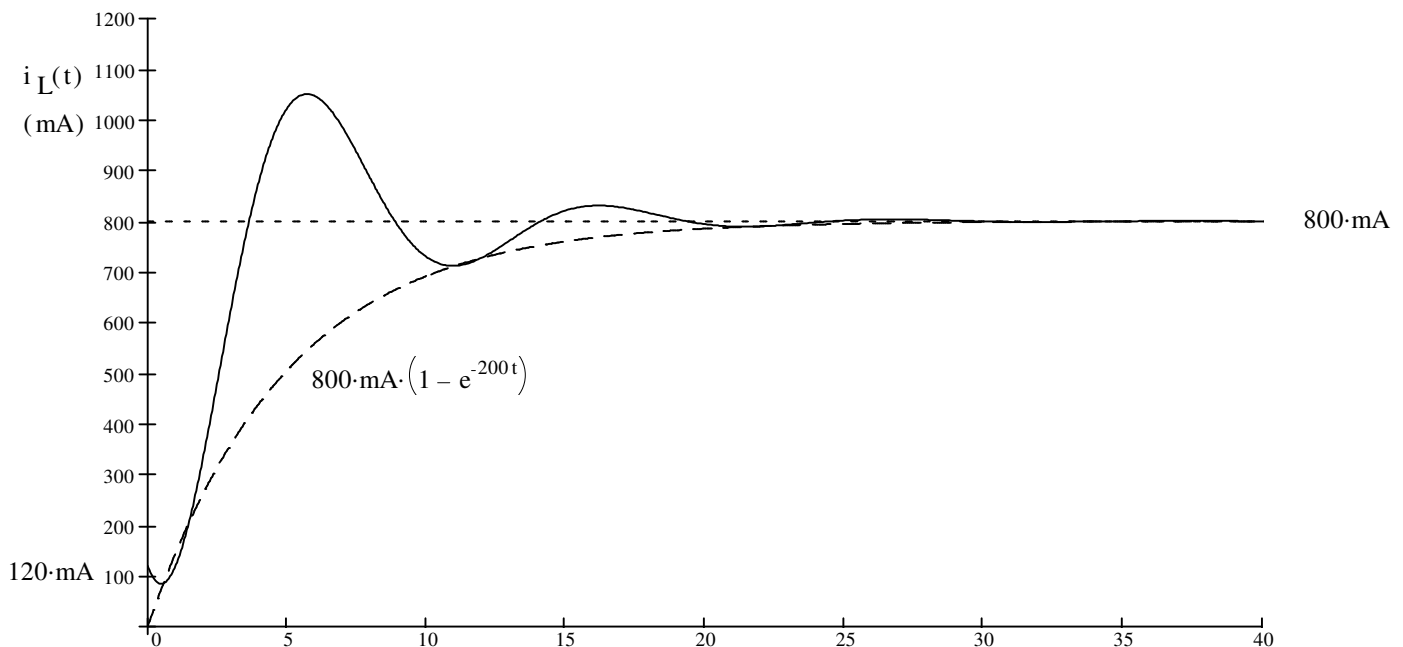

Analysis of a circuit (not pictured) yields the characteristic equation below.

$$0 = s^2 + 800 \cdot s + 160000 \qquad R := 60 \cdot \Omega \qquad L := 350 \cdot mH \qquad C := 20 \cdot \mu F \qquad V_{in} := 12 \cdot V$$

Further analysis yields the following initial and final conditions:

$$i_L(0) = 30 \cdot mA \qquad v_L(0) = -7 \cdot V \qquad v_C(0) = 5 \cdot V \qquad i_C(0) = 70 \cdot mA$$

$$i_L(\infty) = 90 \cdot mA \qquad v_L(\infty) = 0 \cdot V \qquad v_C(\infty) = 12 \cdot V \qquad i_C(\infty) = 0 \cdot mA$$

Write the full expression for $i_L(t)$, including all the constants that you find. $i_L(t) = ?$

Include **units** in your answer

Solution:

$$\frac{-800 + \sqrt{800^2 - 4 \cdot 160000}}{2} = -400 \qquad s_1 := -400 \cdot \frac{1}{sec} \qquad s_2 := -400 \cdot \frac{1}{sec} \qquad \begin{array}{l} s_1 \text{ and } s_2 \text{ are the same,} \\ \textbf{critically damped} \end{array}$$

Initial slope: $\qquad \dfrac{d}{dt} i_L(0) = \dfrac{v_L(0)}{L} = \dfrac{-7 \cdot V}{L} = -20 \cdot \dfrac{A}{sec}$

General solution for the critically damped condition: $i_L(t) = i_L(\infty) + B \cdot e^{s_1 t} + D \cdot t \cdot e^{s_2 t}$

Find constants: $i_L(0) = i_L(\infty) + B \qquad B = i_L(0) - i_L(\infty) \qquad B := 30 \cdot mA - 90 \cdot mA$

$$B = -60 \cdot mA$$

$$\frac{d}{dt} i_L(0) = B \cdot s + D \qquad D := -20 \cdot \frac{A}{sec} - B \cdot s_1 \qquad D = -44 \cdot \frac{A}{sec}$$

Write the full expression for $i_L(t)$,
including all the constants that you find. $i_L(t) := 90 \cdot mA - 60 \cdot mA \cdot e^{-\frac{400}{sec} \cdot t} - 44 \cdot \frac{A}{sec} \cdot t \cdot e^{-\frac{400}{sec} \cdot t}$
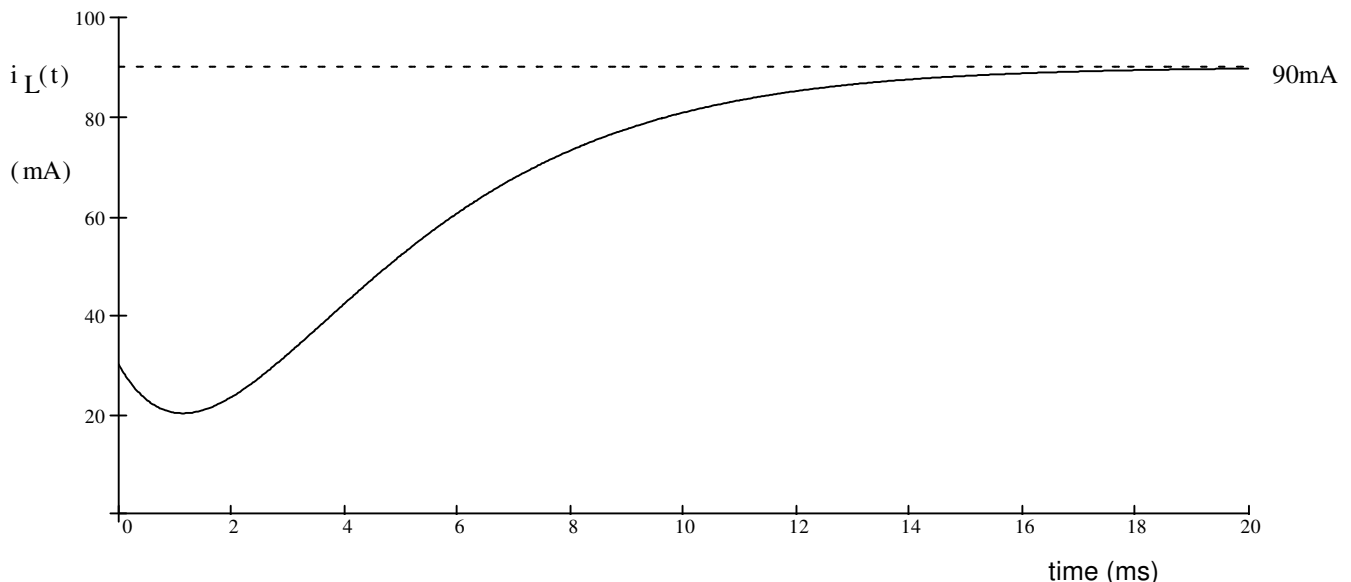

Ex 1. The switch at right has been in the open position for a
   long time and is closed (as shown) at time $t = 0$.

$R_1 := 120 \cdot \Omega$
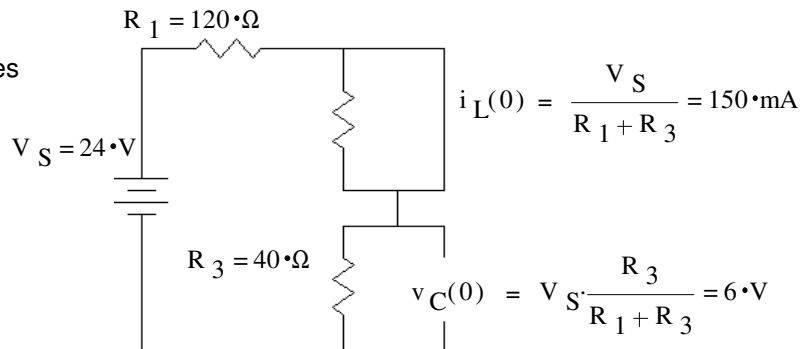

$t = 0$

$V_S := 24 \cdot V$

$R_2 := 80 \cdot \Omega$

$L := 0.5 \cdot mH$

$C := 1.5 \cdot \mu F$

$R_3 := 40 \cdot \Omega$

a) What are the final conditions of i_L and the v_C?

$V_S = 24 \cdot V$

$R_3 := 40 \cdot \Omega$

$R_3 = 40 \cdot \Omega$

$i_L(\infty) = \dfrac{V_S}{R_3} = 600 \cdot mA$
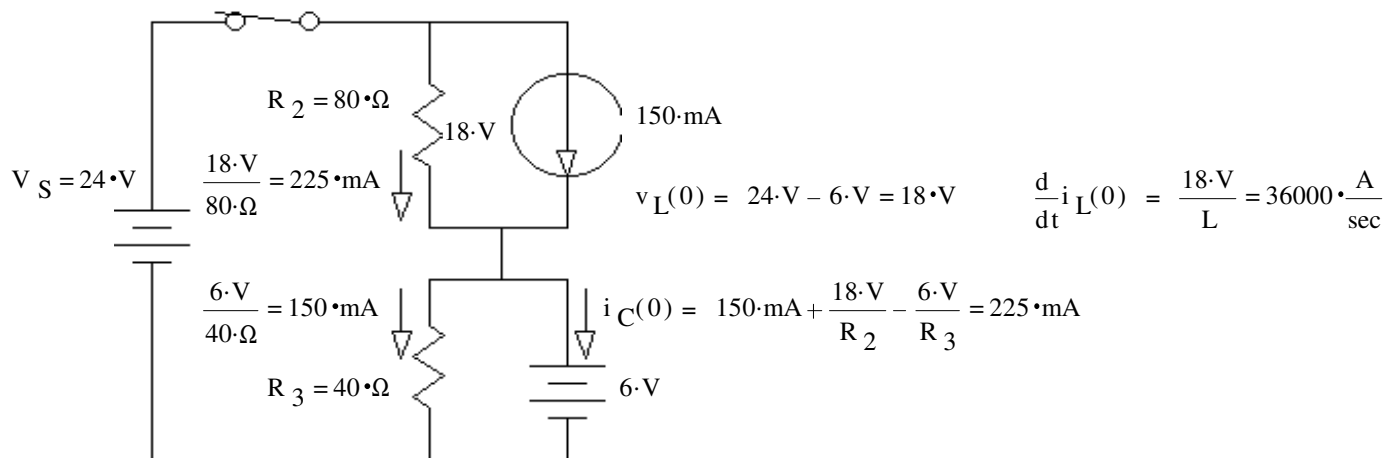

$v_C(\infty) = V_S = 24 \cdot V$
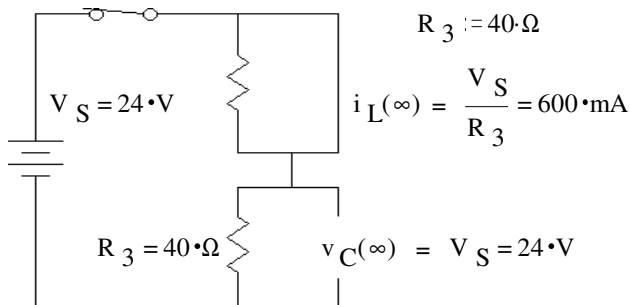

b) Find the initial condition and intial slope of i_L so that you could find all the constants in $i_L(t)$.
   Don't find $i_L(t)$ or it's constants, just the initial conditions.

Before the
switch closes

$R_1 = 120 \cdot \Omega$

$V_S = 24 \cdot V$

$R_3 = 40 \cdot \Omega$

$i_L(0) = \dfrac{V_S}{R_1 + R_3} = 150 \cdot mA$

$v_C(0) = V_S \cdot \dfrac{R_3}{R_1 + R_3} = 6 \cdot V$

Just after the switch closes:

$R_2 = 80 \cdot \Omega$

18·V

150·mA

$V_S = 24 \cdot V$

$\dfrac{18 \cdot V}{80 \cdot \Omega} = 225 \cdot mA$

$v_L(0) = 24 \cdot V - 6 \cdot V = 18 \cdot V$

$\dfrac{d}{dt} i_L(0) = \dfrac{18 \cdot V}{L} = 36000 \cdot \dfrac{A}{sec}$

$\dfrac{6 \cdot V}{40 \cdot \Omega} = 150 \cdot mA$

$i_C(0) = 150 \cdot mA + \dfrac{18 \cdot V}{R_2} - \dfrac{6 \cdot V}{R_3} = 225 \cdot mA$
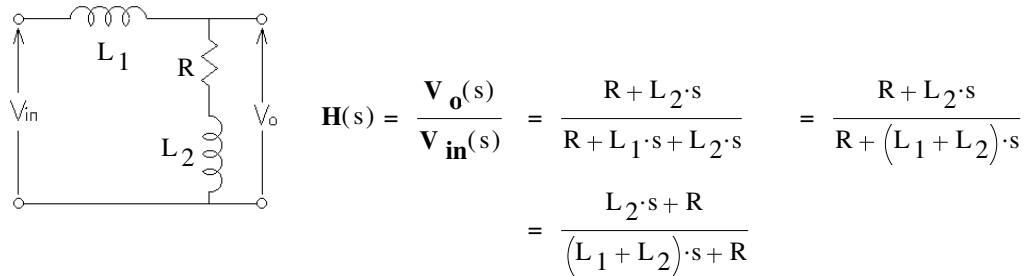

$R_3 = 40 \cdot \Omega$

6·V

c) Find the initial condition and intial slope of v_C so that you could find all the constants in $v_C(t)$.
   Don't find $v_C(t)$ or it's constants, just the initial conditions.

$v_C(0) = V_S \cdot \dfrac{R_3}{R_1 + R_3} = 6 \cdot V$

$\dfrac{d}{di} v_C(0) = \dfrac{225 \cdot mA}{C} = 150000 \cdot \dfrac{V}{sec}$
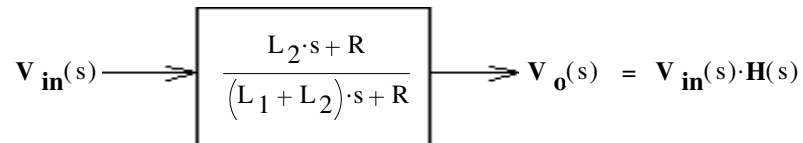

Systems

Now that we' ve developed the concept of the transfer function, we can now develop system block diagrams using blocks which contain transfer functions.
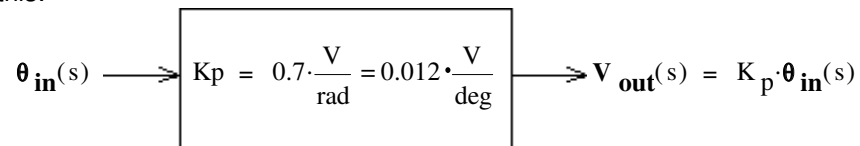

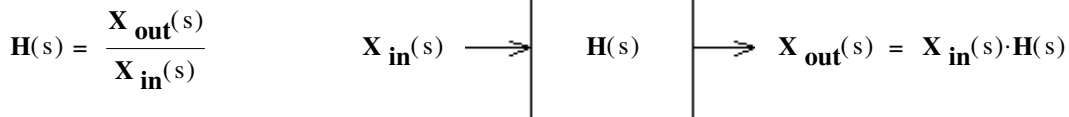

Consider a circuit:

$$H(s) = \frac{V_o(s)}{V_{in}(s)} = \frac{R + L_2 \cdot s}{R + L_1 \cdot s + L_2 \cdot s} = \frac{R + L_2 \cdot s}{R + (L_1 + L_2) \cdot s}$$

$$= \frac{L_2 \cdot s + R}{(L_1 + L_2) \cdot s + R}$$

This could be represented in as a block operator:

$$V_{in}(s) \longrightarrow \boxed{\frac{L_2 \cdot s + R}{(L_1 + L_2) \cdot s + R}} \longrightarrow V_o(s) = V_{in}(s) \cdot H(s)$$

Transfer functions can be written for all kinds of devices and systems, not just electric circuits and the input and output do not have to be similar. For instance, the potentiometers used to measure angular position in the lab servo can be represented like this:

$$\theta_{in}(s) \longrightarrow \boxed{Kp = 0.7 \cdot \frac{V}{rad} = 0.012 \cdot \frac{V}{deg}} \longrightarrow V_{out}(s) = K_p \cdot \theta_{in}(s)$$

In general:

$$H(s) = \frac{X_{out}(s)}{X_{in}(s)}$$

$$X_{in}(s) \longrightarrow \boxed{H(s)} \longrightarrow X_{out}(s) = X_{in}(s) \cdot H(s)$$

X_{in} and X_{out} could be anything from small electrical signals to powerful mechanical motions or forces.

Two blocks with transfer functions $A(s)$ and $B(s)$ in a row would look like this:

$$X_{in}(s) \longrightarrow \boxed{A(s)} \xrightarrow{X_{in}(s) \cdot A(s)} \boxed{B(s)} \longrightarrow X_{out}(s) = X_{in}(s) \cdot A(s) \cdot B(s)$$
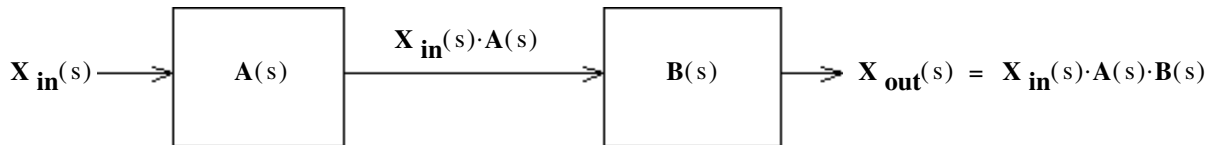

The two blocks could be replaced by a single equivalent block:

$$X_{in}(s) \longrightarrow \boxed{A(s) \cdot B(s)} \longrightarrow X_{out}(s) = X_{in}(s) \cdot A(s) \cdot B(s)$$

$$X_{in}(s) \cdot A(s)$$
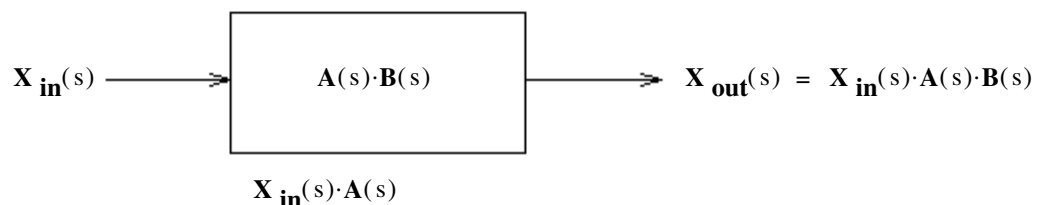

Summer blocks can be used to add signals:

OR

$X_1(s) \longrightarrow \boxed{+}$ (+) $\longrightarrow X_1(s) + X_2(s)$ $X_1(s) \longrightarrow$ (Σ) $\longrightarrow X_1(s) + X_2(s)$

$X_2(s)$ $X_2(s)$

or subtract signals:

OR

$X_1(s) \longrightarrow$ (+) $\longrightarrow X_1(s) - X_2(s)$ $X_1(s) \longrightarrow$ (Σ) $\longrightarrow X_1(s) - X_2(s)$
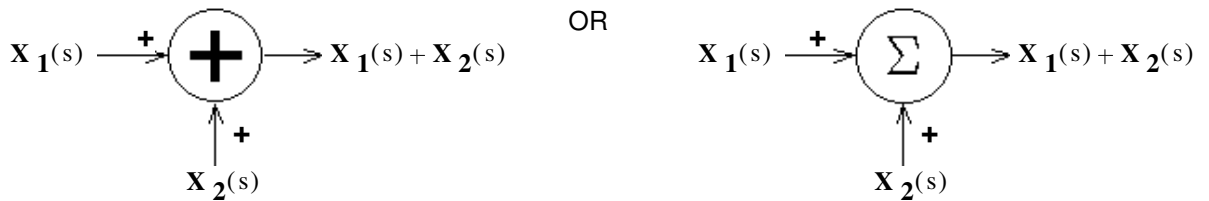

$X_2(s)$ $X_2(s)$
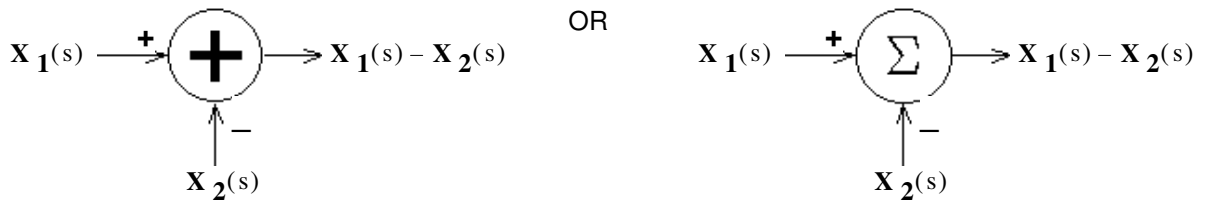

A feedback loop system is particularly interesting and useful:

$X_{in}(s) \longrightarrow$ (Σ) $\longrightarrow \boxed{A(s)} \longrightarrow X_{out}(s)$

$\boxed{B(s)}$
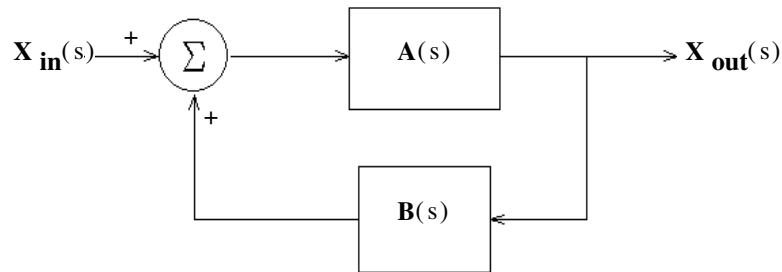

The entire loop can be replaced by a single equivalent block:

Note that I' ve begun to drop the (s)

$X_{in} + B \cdot X_{out}$

$X_{in}(s) \longrightarrow$ (Σ) $\longrightarrow \boxed{A(s)} \longrightarrow X_{out}(s) = A \cdot \left(X_{in} + B \cdot X_{out} \right)$

$= A \cdot X_{in} + A \cdot B \cdot X_{out}$

$B \cdot X_{out}$ $\boxed{B(s)}$

$X_{out} - A \cdot B \cdot X_{out} = A \cdot X_{in}$

$X_{out} \cdot (1 - A \cdot B) = A \cdot X_{in}$

$\dfrac{X_{out}}{X_{in}} = \dfrac{A}{1 - A \cdot B} = H(s)$

The equivalent
transfer function

$X_{in}(s) \longrightarrow \boxed{\dfrac{A(s)}{1 - A(s) \cdot B(s)}} \longrightarrow X_{out}(s)$
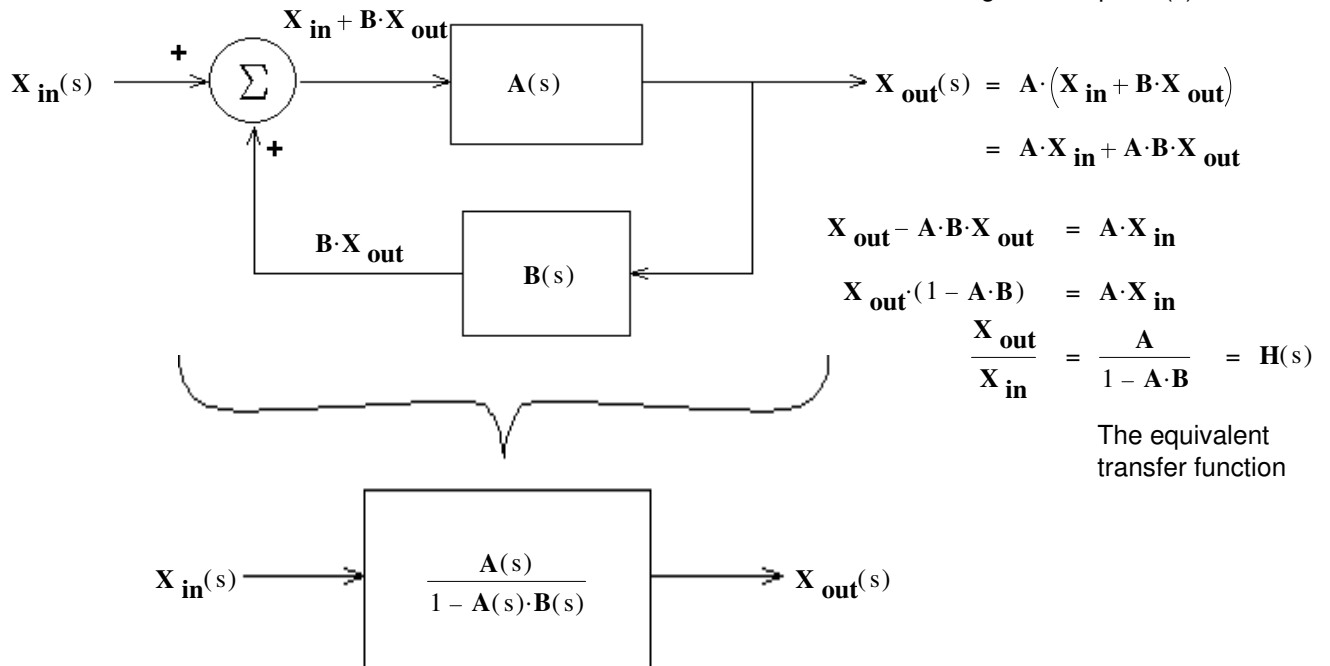

$A(s) \cdot B(s)$ is called the "loop gain" or "open loop gain"

Negative feedback is more common and is used as a control system:

$$X_{in} - B \cdot X_{out}$$

$$X_{out}(s) = A \cdot \left(X_{in} - B \cdot X_{out} \right)$$

$$= A \cdot X_{in} - A \cdot B \cdot X_{out}$$

$$X_{out} + A \cdot B \cdot X_{out} = A \cdot X_{in}$$

$$X_{out} \cdot (1 + A \cdot B) = A \cdot X_{in}$$

$$\frac{X_{out}}{X_{in}} = \frac{A}{1 + A \cdot B} = H(s)$$

The equivalent
transfer function
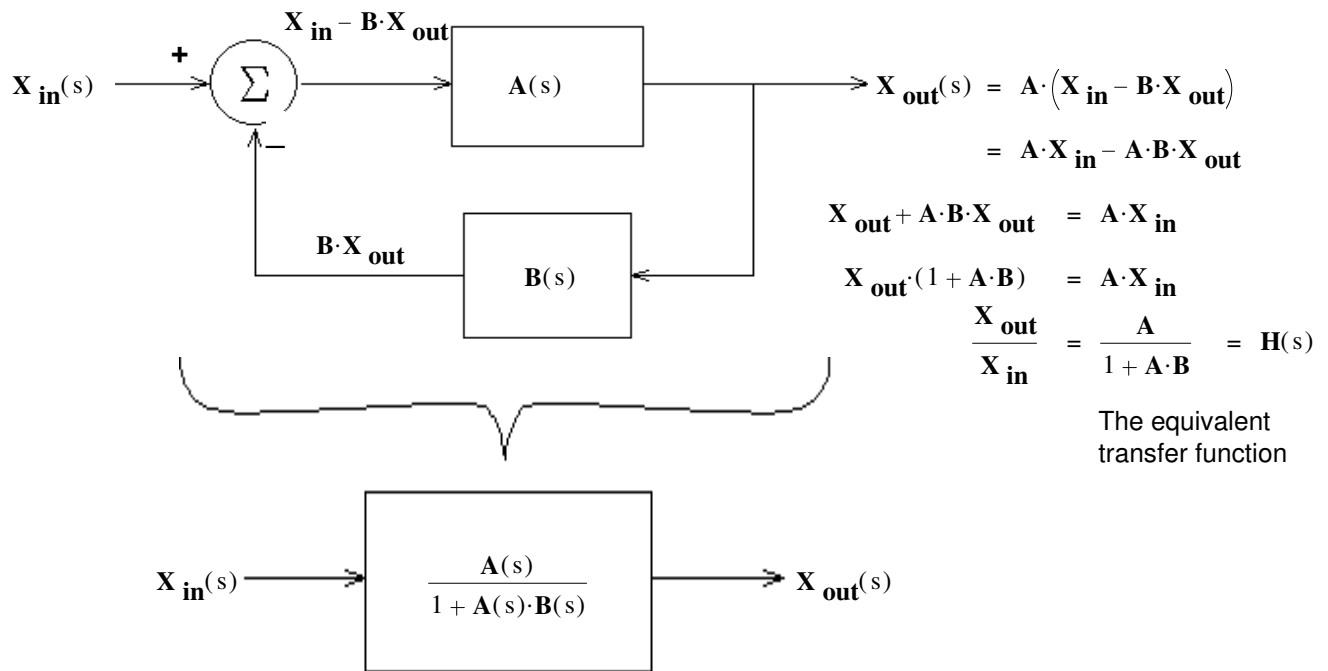

This is called a "closed loop" system, whereas a a system without feedback is called "open loop".
The term "open loop" is often used to describe a system that is out of control.

The servo used in our lab can be represented by:

Input position
Potentiometer   Circuit Gain   Motor and Gears

$$K_p = 0.7 \cdot \frac{V}{rad}$$

Potentiometer constant

Motor Position Potentiometer
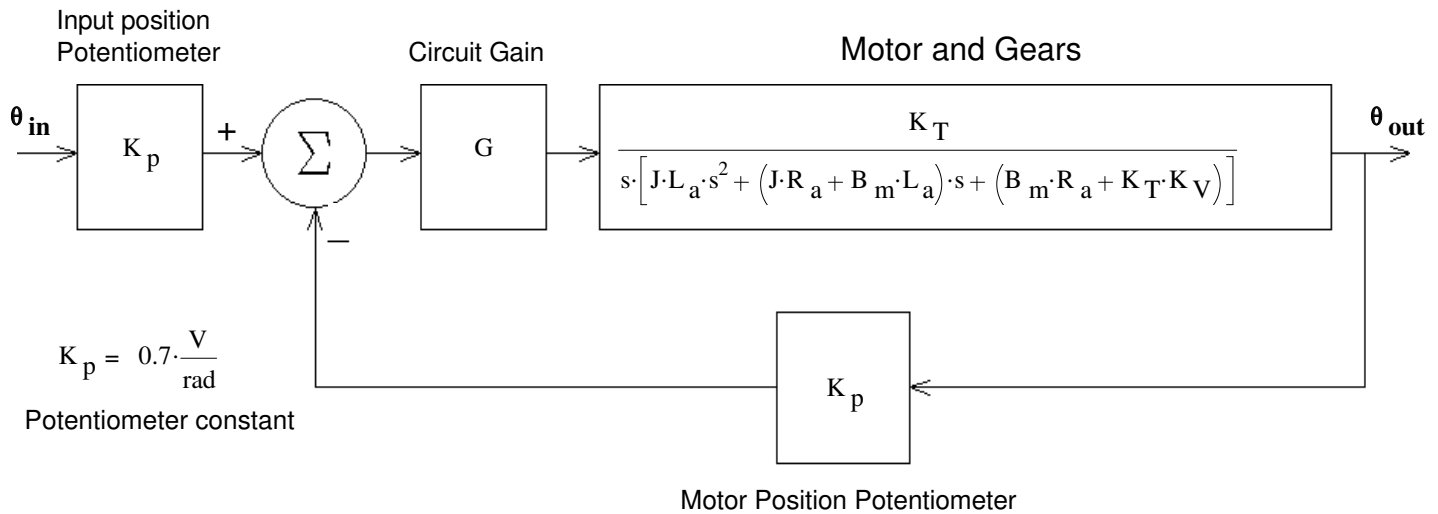

$$H(s) = \frac{\theta_{out}(s)}{\theta_{in}(s)} = \frac{G \cdot K_T \cdot K_p}{s \cdot \left[J \cdot L_a \cdot s^2 + \left(J \cdot R_a + B_m \cdot L_a \right) \cdot s + \left(B_m \cdot R_a + K_T \cdot K_V \right) \right] + K_p \cdot G \cdot K_T}$$

See the appendix to lab 9 for the complete analysis

Note: You already have this in Week09 handouts and/or homework 15-17 handout

1. For the circuit at right:
   a) Find the characteristic equation of the circuit at right.
   b) Find the solutions to the characteristic equation.
   c) Is this circuit over, under, or critically damped?
   d) The switch has been in the top position for a long time and is
      switched down at time $t = 0$. Find the final and initial conditions:

   $$v_C(\infty) \ , \quad i_L(\infty), \quad v_C(0), \quad i_L(0) \ , \quad \frac{d}{dt}v_C(0) \quad \text{and} \quad \frac{d}{dt}i_L(0)$$

   e) Write the full expression for $i_L(t)$, including all the constants
      that you find.

   $R_1 := 8 \cdot \Omega$
   $t = 0$
   $3.6 \cdot V$ $5 \cdot V$ $L := 10 \cdot mH$
 $C := 36 \cdot \mu F$
   $R_2 := 180 \cdot \Omega$
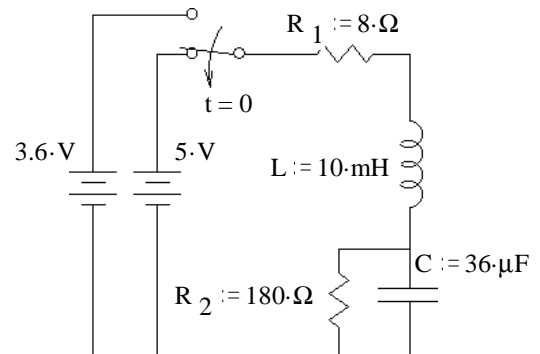

2. a) Find the characteristic equation of the circuit at right.
   b) Find the solutions to the characteristic equation.
   c) Is this circuit over, under, or critically damped?
   d) Find the final conditions: $i_L(\infty)$ and $v_C(\infty)$

   e) The switch has been open for a long time and is switched
      down at time $t = 0$. Find the initial conditions:

   $$i_L(0) \ , \quad v_C(0) \quad \text{and} \quad \frac{d}{dt}v_C(0)$$

   f) Write the full expression for $v_C(t)$, including all the constants.

   $t = 0$ $R_1 := 2200 \cdot \Omega$
   $V_{in} := 8 \cdot V$
   $R_2 := 150 \cdot \Omega$ $C := 40 \cdot \mu F$
   $L := 20 \cdot mH$
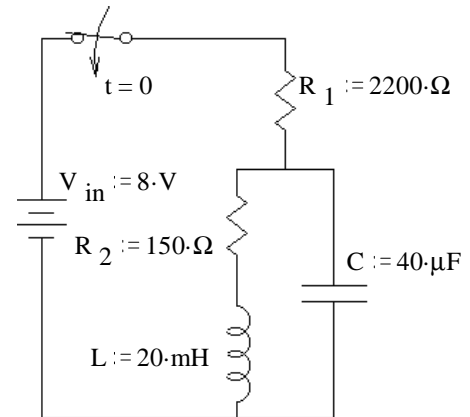

Answers

1. a) $s^2 + \left(\dfrac{R_1}{L} + \dfrac{1}{C \cdot R_2}\right) \cdot s + \left(\dfrac{1}{C \cdot L} + \dfrac{R_1}{R_2 \cdot C \cdot L}\right) = 0$ b) $s_1 := (-477 + 1635j) \cdot \dfrac{1}{\text{sec}}$, $s_2 := (-477 - 1635j) \cdot \dfrac{1}{\text{sec}}$

   c) underdamped   d) $4.79 \cdot V$ $26.6 \cdot mA$ $3.45 \cdot V$ $19.15 \cdot mA$ $0 \cdot \dfrac{V}{\text{sec}}$ $140 \cdot \dfrac{A}{\text{sec}}$

   e) $i_L(t) = 26.6 \cdot mA + e^{\frac{-477.2}{\text{sec}} \cdot t} \cdot \left(-7.45 \cdot \cos\left(\dfrac{1635}{\text{sec}} \cdot t\right) + 83.45 \cdot \sin\left(\dfrac{1635}{\text{sec}} \cdot t\right)\right) \cdot mA$

2a) $0 = s^2 + \left(\dfrac{R_2}{L} + \dfrac{1}{R_1 \cdot C}\right) \cdot s + \left(\dfrac{1}{L \cdot C} + \dfrac{R_2}{R_1 \cdot L \cdot C}\right)$ b) $s_1 := -182.2 \cdot \dfrac{1}{\text{sec}}$, $s_2 := -7329 \cdot \dfrac{1}{\text{sec}}$ c) overdamped

   d) $i_L(\infty) = 3.404 \cdot mA$ $v_C(\infty) = 0.511 \cdot V$ e) $i_L(0) = 0 \cdot mA$ $v_C(0) = 0 \cdot V$ $\dfrac{d}{dt}v_C(0) = 90.91 \cdot \dfrac{V}{\text{sec}}$
   f) $v_C(t) = 0.511 \cdot V - 0.511 \cdot V \cdot e^{-182.2 \cdot t} + 0.000295 \cdot V \cdot e^{-7329 \cdot t}$

1. Analysis of the circuit shown yields the characteristic equation below.
   The switch has been in the top position for a long time and is switched
   down at time $t = 0$. Find the initial conditions and write the full
   expression for $i_L(t)$, including all the constants that you find.

$$s^2 + \left(\frac{1}{C \cdot R_2} + \frac{R_1}{L}\right) \cdot s + \left(\frac{R_1}{L \cdot C \cdot R_2} + \frac{1}{L \cdot C}\right) = 0$$

$$\left(\frac{1}{C \cdot R_2} + \frac{R_1}{L}\right) = 1000 \cdot \sec^{-1} \qquad \left(\frac{R_1}{L \cdot C \cdot R_2} + \frac{1}{L \cdot C}\right) = 2.222 \cdot 10^6 \cdot \sec^{-2}$$

$$s^2 + 1000 \cdot \frac{1}{\sec} \cdot s + 2.222 \cdot 10^6 \cdot \frac{1}{\sec^2} = 0$$

(circuit diagram, right side:)
$t = 0$
$R_1 := 10 \cdot \Omega$
$12 \cdot V$
$4 \cdot V$
$R_2 := 150 \cdot \Omega$
$C := 40 \cdot \mu F$
$L := 12 \cdot mH$

2. What value of R_1 would make the above circuit critically damped?

3. Look at the circuit in HW 17, problem 2. Change R_1 and R_2 to 50Ω and consider the voltage across R_1 to be the
   output voltage.   The transfer function would be:

$$H(s) = \frac{V_{R1}(s)}{V_{in}(s)} = \frac{s^2 + \dfrac{R_2}{L} \cdot s + \dfrac{1}{L \cdot C}}{s^2 + \dfrac{R_1 \cdot R_2 \cdot C + L}{R_1 \cdot L \cdot C} \cdot s + \dfrac{R_1 + R_2}{R_1 \cdot L \cdot C}} = \frac{s^2 + 2500 \cdot s + 1.25 \cdot 10^6}{s^2 + 3000 \cdot s + 2.5 \cdot 10^6}$$

   a) What are the poles and zeros of this transfer function?

   b) Plot these poles and zeros on the complex plane.

4. A feedback system is shown in the figure. a) What is the transfer function of the whole system, with feedback.

$$H(s) = \frac{X_{out}(s)}{X_{in}(s)} = \ ?$$
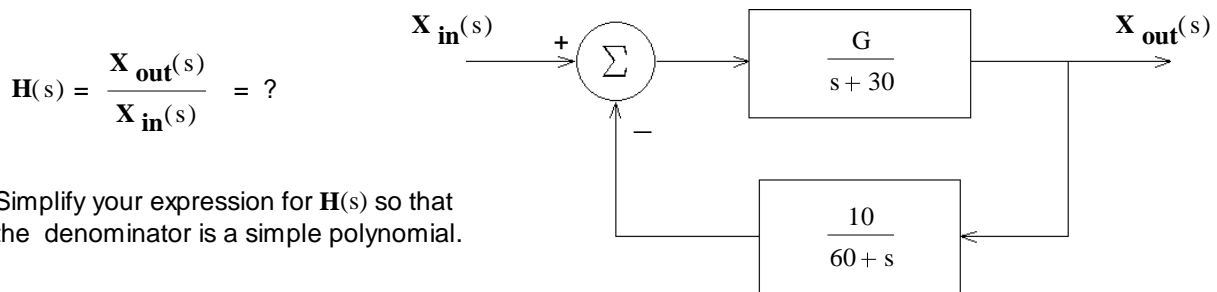

(block diagram:)
$X_{in}(s)$ → $+$ Σ $-$ → $\dfrac{G}{s + 30}$ → $X_{out}(s)$
feedback block: $\dfrac{10}{60 + s}$

   Simplify your expression for $H(s)$ so that
   the denominator is a simple polynomial.

   b) $G := 5$ Find the poles and zeroes of the system.

   c) What type of damping response does this system have?

   d) Find the value of G to make the transfer function critically damped.

   e) If G is double the value found in part d) what will the damping response of the system will be?

5. a) A feedback system is shown in the figure. What is the transfer function of the whole system, with feedback.

$$H(s) = \frac{X_{out}(s)}{X_{in}(s)} = ?$$

$X_{in}(s) \longrightarrow$ [20] $\longrightarrow$ (Σ) $\longrightarrow$ $\left[\dfrac{50}{s+25}\right]$ $\longrightarrow X_{out}(s)$

$\left[\dfrac{-4}{40+s}\right]$ $\longleftarrow$ [-F] $\longleftarrow$

Simplify your expression for $H(s)$ so that
the denominator is a simple polynomial.
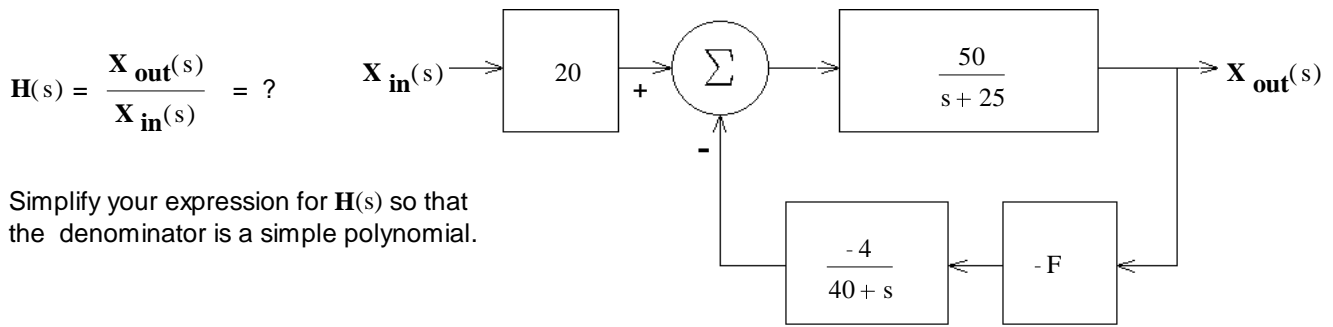

b) Find the maximum value of F so that the system does not become underdamped.

c) Find the transfer function with   F := 0.2

d) With F = 0.2, at what value of s can the system produce an output even with no input?
   (That is, what value of s makes $H(s) = \infty$?)

e) Does the transfer function have a zero? Answer no or find the s value of that zero.

Answers

1 $i_L(0) = 75\cdot mA$ $v_C(0) = 11.25\cdot V$

$$i_L(t) = 25\cdot mA + e^{\frac{-500}{sec}\cdot t}\cdot\left(50\cdot mA\cdot\cos\left(\frac{1404}{sec}\cdot t\right) - 457\cdot mA\cdot\sin\left(\frac{1404}{sec}\cdot t\right)\right)$$

2. $R_1 = 36.64\cdot\Omega$

3. a) Zeroes: - 691 & - 1809   Poles: - 1500 $\pm$ 500·j   b)

4. a) $\dfrac{G\cdot(s+60)}{s^2 + 90\cdot s + 1800 + G\cdot 10}$ b) poles: - 31.8 & - 58.2   zero: - 60

c) overdamped   d) 22.5   e) underdamped

5. a) $1000\cdot\dfrac{s+40}{s^2 + 65\cdot s + 1000 + 200\cdot F}$ b) 0.281   c) $1000\cdot\dfrac{s+40}{s^2 + 65\cdot s + 1040}$ d) - 28.5 or - 36.5

e) - 40
