Ex. 1 For the circuit shown:

a) Find the transfer function \( v_L \).

\[
V_L(s) = \frac{1}{\frac{1}{Ls} + \frac{1}{R}} \cdot V_S(s)
\]

\[
= \frac{1}{1 + \frac{1}{C \cdot s} \left( \frac{1}{Ls} + \frac{1}{R} \right)} \cdot V_S(s)
\]

\[
H(s) = \frac{V_L(s)}{V_S(s)} = \frac{s^2}{s^2 + \frac{1}{C \cdot R} \cdot s + \frac{1}{L \cdot C}}
\]

\[
= \frac{s^2}{s^2 + \frac{3.788 \cdot 10^4}{\text{sec}} \cdot s + \frac{9.091 \cdot 10^9}{\text{sec}^2}}
\]

b) Find the characteristic equation for this circuit.

\[
0 = s^2 + \frac{1}{C \cdot R} \cdot s + \frac{1}{L \cdot C}
\]

Just the denominator set to zero. The solutions of the characteristic equation are the "poles" of the transfer function.

c) Find the differential equation for \( v_L \).

Cross-multiply the transfer function

\[
s^2 \cdot V_S(s) = \left( s^2 + \frac{1}{C \cdot R} \cdot s + \frac{1}{L \cdot C} \right) \cdot V_L(s)
\]

\[
s^2 \cdot V_S(s) = s^2 \cdot V_L(s) + \frac{1}{C \cdot R} \cdot s \cdot V_L(s) + \frac{1}{L \cdot C} \cdot V_L(s)
\]

\[
\frac{d^2}{dt^2} v_S(t) = \frac{d^2}{dt^2} v_L(t) + \frac{1}{C \cdot R} \cdot \frac{d}{dt} v_L(t) + \frac{1}{L \cdot C} \cdot v_L(t)
\]

\[
\frac{d^2}{dt^2} v_S(t) = \frac{d^2}{dt^2} v_L(t) + \frac{3.788 \cdot 10^4}{\text{sec}} \cdot \frac{d}{dt} v_L(t) + \frac{9.091 \cdot 10^9}{\text{sec}^2} \cdot v_L(t)
\]

d) What are the solutions to the characteristic equation?

\[
s_1 = \frac{-3.788 \cdot 10^4}{2} + \frac{1}{2} \sqrt{(3.788 \cdot 10^4)^2 - 4 \cdot \left( \frac{1}{9.091 \cdot 10^9} \right)} = -1.894 \cdot 10^4 + 9.345 \cdot 10^4 j
\]

\[
s_2 = \frac{-3.788 \cdot 10^4}{2} - \frac{1}{2} \sqrt{(3.788 \cdot 10^4)^2 - 4 \cdot \left( \frac{1}{9.091 \cdot 10^9} \right)} = -1.894 \cdot 10^4 - 9.345 \cdot 10^4 j
\]

e) What type of response do you expect from this circuit?  The solutions to the characteristic equation are complex so the response will be underdamped.
Ex. 2 Analysis of the circuit shown yields the characteristic equation below. The switch has been in the open position for a long time and is closed (as shown) at time $t = 0$. Find the initial and final conditions and write the full expression for $i_L(t)$, including all the constants that you find.

$$s^2 + \left(\frac{1}{C - R_1}\right)s + \left(\frac{1}{L - C}\right) = 0$$

$$\left(\frac{1}{C - R_1}\right)s + 2\cdot 10^{-7} \cdot \frac{1}{sec^2} = -\frac{10000}{2} + \frac{1}{2}\sqrt{(10000)^2 - 4\cdot (2\cdot 10^{-7})} \cdot sec^{-1}$$

$$s_1 = \frac{-10000}{2} + \frac{1}{2}\sqrt{(10000)^2 - 4\cdot (2\cdot 10^{-7})} \cdot sec^{-1}$$

$$s_2 = \frac{-10000}{2} - \frac{1}{2}\sqrt{(10000)^2 - 4\cdot (2\cdot 10^{-7})} \cdot sec^{-1}$$

$s_1 = -2764 \cdot sec^{-1}$

$s_2 = -7236 \cdot sec^{-1}$

$s_1$ and $s_2$ are both real and distinct, overdamped

Find the initial conditions:

Before the switch closed, the inductor current was:

$$i_L(0) = \frac{15V}{R_1 + R_2} = 30 \cdot mA$$

Before the switch closed, the capacitor voltage was:

$$v_C(0) = \frac{V_{in}}{R_2} = 9V$$

When the switch is closed, the inductor is suddenly in parallel with the capacitor, and:

$$v_L(0) = v_C(0)$$

$$\frac{d}{dt}i_L(0) = \frac{1}{L}v_L(0) = \frac{1}{9\cdot V} \cdot 90 \cdot \frac{A}{sec}$$

Find the final condition:

$$i_L(\infty) = \frac{15V}{R_1} = 75 \cdot mA$$

$$v_C(\infty) = 0V$$

General solution for the overdamped condition:

$$i_L(t) = i_L(\infty) + B \cdot e^{s_1 t} + D \cdot e^{s_2 t}$$

Initial conditions:

$$i_L(0) = \frac{15V}{R_1 + R_2} = i_L(\infty) + B + D$$

$$\frac{d}{dt}i_L(0) = \frac{90 \cdot A}{sec} = s_1 \cdot B + s_2 \cdot D$$

$$i_L(0) = 30 \cdot mA - 75 \cdot mA - D$$

$$s_1 \cdot (-45 \cdot mA - D) + s_2 \cdot D = s_1 \cdot (-45 \cdot mA - s_1 \cdot D + s_2 \cdot D$$

solve for $D$ & $B$:

$$D = 7.69 \cdot mA$$

$$B = -45 \cdot mA - D$$

$$B = -52.7 \cdot mA$$

Plug numbers back in:

$$i_L(t) = 75 \cdot mA - 52.7 \cdot mA \cdot e^{2764t} + 7.69 \cdot mA \cdot e^{-7236t}$$

Starts at 30mA

Initial slope:

$$\frac{i_L(0.00001) - i_L(0)}{0.00001 \cdot sec} = 89.989 \cdot \frac{A}{sec}$$

Ends at 75mA
Ex. 3
Analysis of the circuit shown yields the characteristic equation and s values below. The switch has been in the closed position for a long time and is opened (as shown) at time $t = 0$. Find the initial and final conditions and write the full expression for $v_C(t)$, including all the constants.

$$0 = s^2 + \frac{R_1}{L}s + \frac{1}{LC}$$

$s_1 := \left( -\frac{250}{10^4} + j \right) \frac{1}{\text{sec}}, \quad s_2 := \left( -\frac{250}{10^4} - j \right) \frac{1}{\text{sec}}$

Solution:
$$\alpha := -250 \frac{1}{\text{sec}}, \quad \omega := 10000 \frac{\text{rad}}{\text{sec}}$$

Initial conditions:

before switch opens

$$i_L(0) = \frac{V_{\text{in}}}{R_1 + R_2} = 100 \cdot \text{mA}$$

$$v_C(0) = V_{\text{in}} \cdot \frac{R_2}{R_1 + R_2} = 6 \cdot V$$

just after the switch opens

$$\frac{d}{dt}v_C(0) = \frac{i_C(0)}{C} = \frac{100 \cdot \text{mA}}{C} = 8 \cdot 10^5 \frac{V}{\text{sec}}$$

Find final condition:

$$v_C(\infty) = V_{\text{in}} = 10 \cdot V$$

Find constants:

$$v_C(0) = v_C(\infty) + B$$

$$B = v_C(0) - v_C(\infty)$$

$$B := 6 \cdot V - 10 \cdot V \quad B = -4 \cdot V$$

$$\frac{d}{dt}v_C(0) = \alpha \cdot B + D \cdot \omega$$

$$D := \frac{8 \cdot 10^5 V}{\text{sec}} \cdot \frac{1}{\omega}$$

$$D = 79.9 \cdot V$$

Write the full expression for $v_C(t)$, including all the constants that you find.

$$v_C(t) = e^{\alpha t} \cdot (B \cdot \cos(\omega \cdot t) + D \cdot \sin(\omega \cdot t)) + v_C(\infty)$$

$$v_C(t) := e^{250t} \cdot \left( -4 \cdot V \cdot \cos(10^4 t) + 79.9 \cdot V \cdot \sin(10^4 t) \right) + 10 \cdot V$$

$$\sqrt{D^2 + B^2} = 80 \cdot V$$

$$v_C(0) \text{ (volts)}$$

ECE 2210 Lecture 18 notes p3
Ex. 4  Ex.3 Backwards, switch closes at \( t = 0 \)

Characteristic eq.: 
\[
0 = s^2 + \left( \frac{1}{C \cdot R_2} + \frac{R_1}{L} \right) s + \left( 1 + \frac{R_1}{R_2} \right) \frac{1}{L \cdot C}
\]

\[
\begin{align*}
    s_1 & = -1.257 \times 10^3 \frac{1}{\text{sec}} \\
    s_2 & = -1.326 \times 10^5 \frac{1}{\text{sec}}
\end{align*}
\]

Initial conditions, same as Ex.3 final:
\[
\begin{align*}
    v_C(0) & = V_{\text{in}} = 10 \cdot V \\
    i_L(\infty) & = \frac{V_{\text{in}}}{R_1 + R_2} = 100 \cdot \text{mA}
\end{align*}
\]

Find final condition:

before switch opens
\[
\begin{align*}
    v_C(\infty) & = V_{\text{in}} \frac{R_2}{R_1 + R_2} = 6 \cdot V
\end{align*}
\]

Find constants: 
\[
v_C(t) = v_C(\infty) + B + D, \quad \text{so} \quad B = v_C(0) - v_C(\infty) - D = 10 \cdot V - 6 \cdot V - D = 4 \cdot V - D
\]
\[
\frac{d}{dt}v_C(t) = -1.334 \times 10^6 \frac{V}{\text{sec}} = s_1 \cdot B + s_2 \cdot D = s_1 \cdot (4 \cdot V - D) + s_2 \cdot D = s_1 \cdot (4 \cdot V) - s_1 \cdot D + s_2 \cdot D
\]
\[
D := \frac{-1.334 \times 10^6 \frac{V}{\text{sec}}}{-s_1 + s_2}
\]
\[
\begin{align*}
    D & = 10.12 \cdot V \\
    B & = 4 \cdot V - D \\
    B & = -6.12 \cdot V
\end{align*}
\]
\[
v_C(t) := 6 \cdot V - 6.12 \cdot V \cdot e^{-1257t} + 10.12 \cdot V \cdot e^{-132600t}
\]
Ex. 5  Analysis of a circuit (not pictured) yields the characteristic equation below.

\[0 = s^2 + 400s + 400000\]

Further analysis yields the followiing initial and final conditions:

- \[i_L(0) = 120\text{ mA}\]
- \[v_L(0) = -3\text{ V}\]
- \[v_C(0) = 7\text{ V}\]
- \[i_C(0) = -80\text{ mA}\]
- \[i_L(\infty) = 800\text{ mA}\]
- \[v_L(\infty) = 0\text{ V}\]
- \[v_C(\infty) = 12\text{ V}\]
- \[i_C(\infty) = 0\text{ mA}\]

Write the full expression for \(i_L(t)\), including all the constants that you find.

\[i_L(t) = ?\]

Solution:

\[
\begin{align*}
\frac{400}{2} &= 200 \\
\frac{\sqrt{400^2 - 4 \cdot 400000}}{2} &= 600j \\
\end{align*}
\]

\[
\begin{align*}
s_1 &= (-200 + 600j) \cdot \frac{1}{\text{sec}} \\
and \\
s_2 &= (-200 - 600j) \cdot \frac{1}{\text{sec}}
\end{align*}
\]

\[
\begin{align*}
\alpha &= \text{Re}(s_1) \\
&= -200 \text{ sec}^{-1}
\end{align*}
\]

\[
\omega = \text{Im}(s_1) \\
&= 600 \text{ sec}^{-1}
\]

Initial slope:

\[
\frac{d}{dt} i_L(0) = \frac{v_L(0)}{L} = \frac{-3}{L} \text{A} \text{ sec}^{-1}
\]

General solution for the underdamped condition: \[i_L(t) = i_L(\infty) + e^{\alpha t}(B \cdot \cos(\omega t) + D \cdot \sin(\omega t))\]

Find constants:

\[
\begin{align*}
i_L(0) &= i_L(\infty) + B \\
B &= i_L(0) - i_L(\infty) \\
B &= 120\text{ mA} - 800\text{ mA} \\
B &= -680\text{ mA}
\end{align*}
\]

\[
\begin{align*}
\frac{d}{dt} i_L(0) &= \alpha B + D \cdot \omega \\
D &= \frac{-150}{\omega} \text{sec} \cdot \alpha B \\
D &= -476.667 \text{ mA}
\end{align*}
\]

Write the full expression for \(i_L(t)\), including all the constants that you find.

\[
i_L(t) = 800\text{ mA} + e^{200t}( -680\text{ mA} \cdot \cos(600t) - 477\text{ mA} \cdot \sin(600t) )
\]
Analysis of a circuit (not pictured) yields the characteristic equation below.

\[ 0 = s^2 + 800s + 160000 \]

Further analysis yields the following initial and final conditions:

- \( i_L(0) = 30 \text{ mA} \)
- \( v_L(0) = -7 \text{ V} \)
- \( v_C(0) = 5 \text{ V} \)
- \( i_C(0) = 70 \text{ mA} \)
- \( i_L(\infty) = 90 \text{ mA} \)
- \( v_L(\infty) = 0 \text{ V} \)
- \( v_C(\infty) = 12 \text{ V} \)
- \( i_C(\infty) = 0 \text{ mA} \)

Write the full expression for \( i_L(t) \), including all the constants that you find.

\[ i_L(t) = ? \]

Include units in your answer

Solution:

\[ s_1 = \frac{-800 + \sqrt{800^2 - 4 \cdot 160000}}{2} = -400 \]

\[ s_2 = \frac{-800 - \sqrt{800^2 - 4 \cdot 160000}}{2} \]

Initial slope:

\[ \frac{d}{dt} i_L(0) = \frac{v_L(0)}{L} = \frac{-7}{L} = -20 \frac{A}{sec} \]

General solution for the critically damped condition:

\[ i_L(t) = i_L(\infty) + B \cdot e^{s_1 t} + D \cdot e^{s_2 t} \]

Find constants:

\[ B = i_L(0) - i_L(\infty) \]

\[ B = -60 \text{ mA} \]

\[ D = \frac{400}{s_2} \text{ sec} \]

\[ D = -44 \frac{A}{sec} \]

Write the full expression for \( i_L(t) \), including all the constants that you find.

\[ i_L(t) = 90 \text{ mA} - 60 \text{ mA} \cdot e^{-\frac{400}{s_2} t} - 44 \frac{A}{sec} \cdot t \cdot e^{-\frac{400}{s_2} t} \]
Ex 1. The switch at right has been in the open position for a long time and is closed (as shown) at time $t = 0$.

a) What are the final conditions of $i_L$ and the $v_C$?

$$i_L(\infty) = \frac{V_S}{R_3} = 600 \text{mA}$$

$$v_C(\infty) = V_S = 24 \text{V}$$

b) Find the initial condition and initial slope of $i_L$ so that you could find all the constants in $i_L(t)$.

Don't find $i_L(t)$ or its constants, just the initial conditions.

Before the switch closes:

$$i_L(0) = \frac{V_S}{R_1 + R_3} = 150 \text{mA}$$

$$v_C(0) = V_S \frac{R_3}{R_1 + R_3} = 6 \text{V}$$

Just after the switch closes:

$$v_L(0) = 24 \text{V} - 6 \text{V} = 18 \text{V}$$

$$\frac{di_L(0)}{dt} = \frac{18 \text{V}}{L} = 36000 \text{A/sec}$$

$$v_C(0) = V_S \frac{R_3}{R_1 + R_3} = 6 \text{V}$$

$$\frac{dv_C(0)}{dt} = \frac{225 \text{mA}}{C} = 150000 \text{V/sec}$$
Now that we’ve developed the concept of the transfer function, we can now develop system block diagrams using blocks which contain transfer functions.

Consider a circuit:

\[
\begin{align*}
H(s) &= \frac{V_o(s)}{V_in(s)} = \frac{R + L_2 s}{R + L_1 s + L_2 s} = \frac{R + L_2 s}{R + (L_1 + L_2) s + R} \\
&= \frac{L_2 s + R}{(L_1 + L_2) s + R}
\end{align*}
\]

This could be represented in as a block operator:

\[
\begin{array}{c}
V_in(s) \\
\downarrow \\
H(s) \\
\downarrow \\
V_out(s) = V_in(s) \cdot H(s)
\end{array}
\]

Transfer functions can be written for all kinds of devices and systems, not just electric circuits and the input and output do not have to be similar. For instance, the potentiometers used to measure angular position in the lab servo can be represented like this:

\[
\begin{align*}
\theta_{in}(s) &\xrightarrow{K_p = 0.7 \frac{V}{\text{rad}} = 0.012 \frac{V}{\text{deg}}} \theta_{out}(s) = K_p \theta_{in}(s)
\end{align*}
\]

In general:

\[
H(s) = \frac{X_{out}(s)}{X_{in}(s)} \\
\begin{array}{c}
X_{in}(s) \\
\downarrow \\
H(s) \\
\downarrow \\
X_{out}(s) = X_{in}(s) \cdot H(s)
\end{array}
\]

\(X_{in}\) and \(X_{out}\) could be anything from small electrical signals to powerful mechanical motions or forces.

Two blocks with transfer functions \(A(s)\) and \(B(s)\) in a row would look like this:

\[
\begin{array}{c}
X_{in}(s) \\
\downarrow \\
A(s) \\
\downarrow \\
X_{in}(s) \cdot A(s) \\
\downarrow \\
B(s) \\
\downarrow \\
X_{out}(s) = X_{in}(s) \cdot A(s) \cdot B(s)
\end{array}
\]

The two blocks could be replaced by a single equivalent block:

\[
\begin{array}{c}
X_{in}(s) \\
\downarrow \\
A(s) \cdot B(s) \\
\downarrow \\
X_{out}(s) = X_{in}(s) \cdot A(s) \cdot B(s)
\end{array}
\]
Summer blocks can be used to add signals:

\[ X_1(s) + X_2(s) \]

or subtract signals:

\[ X_1(s) - X_2(s) \]

A feedback loop system is particularly interesting and useful:

\[ X_{in}(s) + X_{in} \cdot B \cdot X_{out}(s) \]

The entire loop can be replaced by a single equivalent block:

\[ X_{in}(s) + X_{in} \cdot B \cdot X_{out}(s) \]

Note that I’ve begun to drop the (s)

\[ X_{out}(s) = A \cdot X_{in} \]

The equivalent transfer function

\[ A(s) \cdot B(s) \] is called the "loop gain" or "open loop gain"
Negative feedback is more common and is used as a control system:

\[
X_{\text{in}}(s) + B \cdot X_{\text{out}} \rightarrow \sum \rightarrow A(s) \rightarrow X_{\text{out}}(s) = A \cdot (X_{\text{in}} - B \cdot X_{\text{out}}) = A \cdot X_{\text{in}} - A \cdot B \cdot X_{\text{out}}
\]

\[
X_{\text{out}} + A \cdot B \cdot X_{\text{out}} = A \cdot X_{\text{in}}
\]

\[
X_{\text{out}}(1 + A \cdot B) = A \cdot X_{\text{in}}
\]

\[
\frac{X_{\text{out}}}{X_{\text{in}}} = \frac{A}{1 + A \cdot B} = H(s)
\]

The equivalent transfer function

This is called a "closed loop" system, whereas a system without feedback is called "open loop". The term "open loop" is often used to describe a system that is out of control.

The servo used in our lab can be represented by:

\[
\theta_{\text{in}} \rightarrow K_p + \sum \rightarrow G \rightarrow \theta_{\text{out}}
\]

\[
K_p = 0.7 \text{ V/ rad}
\]

Potentiometer constant

\[
\frac{\theta_{\text{out}}(s)}{H(s)} = \frac{G \cdot K_T \cdot K_p}{s \left[ J_L \cdot a \cdot s^2 + \frac{J_R}{m \cdot L_a}s + \left( B_m \cdot R_a + K_T \cdot K_V \right) \right]}
\]

See the appendix to lab 9 for the complete analysis
1. For the circuit at right:
   a) Find the characteristic equation of the circuit at right.
   b) Find the solutions to the characteristic equation.
   c) Is this circuit over, under, or critically damped?
   d) The switch has been in the top position for a long time and is
      switched down at time $t = 0$. Find the final and initial conditions:
      
      $v_C(\infty)$, $i_L(\infty)$, $v_C(0)$, $i_L(0)$, $\frac{d}{dt}v_C(0)$ and $\frac{d}{dt}i_L(0)$

   e) Write the full expression for $i_L(t)$, including all the constants
      that you find.

2. a) Find the characteristic equation of the circuit at right.
   b) Find the solutions to the characteristic equation.
   c) Is this circuit over, under, or critically damped?
   d) Find the final conditions: $i_L(\infty)$ and $v_C(\infty)$
   e) The switch has been open for a long time and is switched
      down at time $t = 0$. Find the initial conditions:
      
      $i_L(0)$, $v_C(0)$ and $\frac{d}{dt}v_C(0)$

   f) Write the full expression for $v_C(t)$, including all the constants.

Answers

1. a) $s^2 + \left(\frac{R_1}{L} + \frac{1}{R_2C} \right)s + \left(\frac{1}{C} + \frac{R_1}{R_2C} \right) = 0$
   
   b) $s_1 := (-477 + 1635j) \frac{1}{sec}$, $s_2 := (-477 - 1635j) \frac{1}{sec}$

   c) underdamped

   d) $i_L(t) = \frac{-477}{2} \cdot V \cdot e^{182.2 \cdot t} + 7329 \cdot V \cdot e^{-182.2 \cdot t}$

   e) $i_L(t) = 26.6 \cdot mA + \frac{477}{2} \cdot m\text{A} \cdot e^{-182.2 \cdot t}$

   f) $v_C(t) = 0.511 \cdot V - 0.511 \cdot V \cdot e^{182.2 \cdot t} + 0.000295 \cdot V \cdot e^{-7329 \cdot t}$

2a) $0 = s^2 + \left(\frac{R_2}{L} + \frac{1}{R_1C} \right)s + \left(\frac{1}{L} + \frac{R_2}{R_1C} \right)$

   b) $s_1 := -182.2 \frac{1}{sec}$, $s_2 := -7329 \frac{1}{sec}$

   c) overdamped
1. Analysis of the circuit shown yields the characteristic equation below. The switch has been in the top position for a long time and is switched down at time $t = 0$. Find the initial conditions and write the full expression for $i_L(t)$, including all the constants that you find.

$$s^2 + \left( \frac{1}{C \cdot R_2} \right) s + \left( \frac{R_1}{L \cdot C \cdot R_2} + \frac{1}{L \cdot C} \right) = 0$$

$$\left( \frac{1}{C \cdot R_2} + \frac{R_1}{L} \right) = 1000 \cdot \text{sec}^{-1}$$

$$\left( \frac{R_1}{L \cdot C \cdot R_2} + \frac{1}{L \cdot C} \right) = 2.222 \cdot 10^6 \cdot \text{sec}^{-2}$$

$$s^2 + 1000 \frac{1}{\text{sec}} s + 2.222 \cdot 10^6 \frac{1}{\text{sec}^2} = 0$$

2. What value of $R_1$ would make the above circuit critically damped?

3. Look at the circuit in HW 17, problem 2. Change $R_1$ and $R_2$ to 50Ω and consider the voltage across $R_1$ to be the output voltage. The transfer function would be:

$$H(s) = \frac{V_{R1}(s)}{V_{in}(s)} = \frac{s^2 + \frac{R_2}{L} s + \frac{1}{L \cdot C}}{s^2 + \frac{R_1 \cdot R_2 \cdot C}{R_1 \cdot L \cdot C} s + \frac{R_1 + R_2}{R_1 \cdot L \cdot C}} = \frac{s^2 + 2500 s + 1.25 \cdot 10^6}{s^2 + 3000 s + 2.5 \cdot 10^6}$$

a) What are the poles and zeros of this transfer function?

b) Plot these poles and zeros on the complex plane.

4. A feedback system is shown in the figure. a) What is the transfer function of the whole system, with feedback.

$$H(s) = \frac{X_{out}(s)}{X_{in}(s)} = \frac{G}{s + 30}$$

Simplify your expression for $H(s)$ so that the denominator is a simple polynomial.

b) $G = 5$ Find the poles and zeroes of the system.

c) What type of damping response does this system have?

d) Find the value of $G$ to make the transfer function critically damped.

e) If $G$ is double the value found in part d) what will the damping response of the system will be?
ECE 2210 homework # 18 p2

5. a) A feedback system is shown in the figure. What is the transfer function of the whole system, with feedback.

\[ H(s) = \frac{X_{out}(s)}{X_{in}(s)} = ? \]

\[ X_{in}(s) \rightarrow 20 + \sum \rightarrow \frac{50}{s + 25} \rightarrow X_{out}(s) \]

Simplify your expression for \( H(s) \) so that the denominator is a simple polynomial.

b) Find the maximum value of \( F \) so that the system does not become underdamped.

c) Find the transfer function with \( F = 0.2 \)

d) With \( F = 0.2 \), at what value of \( s \) can the system produce an output even with no input? (That is, what value of \( s \) makes \( H(s) = \infty \)?)

e) Does the transfer function have a zero? Answer no or find the \( s \) value of that zero.

Answers

1. \( i_L(0) = 75\, \text{mA} \quad V_C(0) = 11.25\, \text{V} \)

\[ i_L(t) = 25\, \text{mA} + e^{\frac{500}{\sec}} \left( \frac{1404}{\sec} \cos \left( \frac{1404}{\sec} t \right) - \frac{457}{\sec} \sin \left( \frac{1404}{\sec} t \right) \right) \]

2. \( R_1 = 36.64\, \Omega \)

3. a) Zeroes: -691 & -1809  Poles: -1500 + 500j  

b) \[ \begin{array}{c} \text{Zeroes: -691 & -1809} \\ \text{Poles: -1500 + 500j} \end{array} \]

4. a) \( \frac{G(s + 60)}{s^2 + 90s + 1800 + G\cdot10} \)

b) Poles: -31.8 & 58.2  

c) Overdamped  

d) 22.5  

e) Underdamped

5. a) \( \frac{s + 40}{s^2 + 65s + 1000 + 200\cdot F} \)

b) 0.281

c) \( \frac{s + 40}{s^2 + 65s + 1040} \)

d) -28.5 or -36.5

e) -40
