RMS

DC Power

AC Power

$P = ?$

$$P = V \cdot I = \frac{V^2}{R} = I^2 \cdot R$$

$$v(t) = V_p \cdot \cos(\omega \cdot t)$$

R

$v(t)$

V_p

t

$p(t)$

$\dfrac{V_p^{\,2}}{R}$

average or "effective" power $= \dfrac{\left(\dfrac{V_p^{\,2}}{R}\right)}{2}$
Couldn't we define an "effective" voltage that would allow us to use the same relationships for AC power as used for DC power?

$$P_{ave} = \frac{\left(\dfrac{V_p^{\,2}}{R}\right)}{2} = \frac{\left(\dfrac{V_p^{\,2}}{2}\right)}{R} = \frac{\left(\dfrac{V_p}{\sqrt{2}}\right)^2}{R}$$

$V_p^{\,2} \dfrac{v(t)^2}{}$

$$V_{eff} = \sqrt{\left(\dfrac{V_p}{\sqrt{2}}\right)^2} = \frac{V_p}{\sqrt{2}} = V_{rms} = \sqrt{\frac{1}{T} \cdot \int_0^T (v(t))^2 \, dt}$$

Square

Mean (average)

Root

average $= \dfrac{V_p^{\,2}}{2}$

t
RMS   **R**oot of the **M**ean of the **S**quare

Use RMS in power calculations

Sinusoids

$$V_{rms} = \sqrt{\frac{1}{T} \cdot \int_0^T (v(t))^2 \, dt} = \sqrt{\frac{1}{T} \cdot \int_0^T \left(V_p \cdot \cos(\omega \cdot t)\right)^2 \, dt} = \sqrt{\frac{1}{T} \cdot \int_0^T V_p^{\,2} \cdot \left(\frac{1}{2} + \frac{1}{2} \cdot \cos(2 \cdot \omega \cdot t)\right) \, dt}$$

$$= \frac{V_p}{\sqrt{2}} \cdot \sqrt{\frac{1}{T} \cdot \int_0^T (1) \, dt + \frac{1}{T} \cdot \int_0^T \cos(2 \cdot \omega \cdot t) \, dt} = \frac{V_p}{\sqrt{2}} \cdot \sqrt{1 + 0}$$
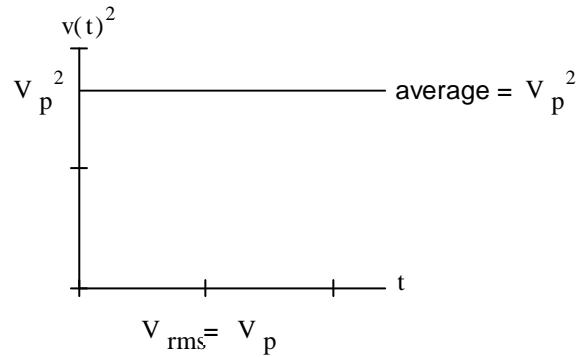

Common household power

$f = 60 \cdot Hz$
$\omega = 377 \cdot \dfrac{rad}{sec}$

$T = 16.67 \cdot ms$

Neutral, N
white
(also ground)

Line, L
black, 120V

Ground, G, green

$V_{rms} := 120 \cdot V$

$V_p = V_{rms} \cdot \sqrt{2} = 170 \cdot V$

What about other wave shapes??

Triangular

$v(t)$

V_p

$v(t)^2$

V_p^2

average $= \dfrac{V_p^2}{3}$

$V_{rms} = \dfrac{V_p}{\sqrt{3}}$

Works for all types of triangular and sawtooth waveforms

Square

$v(t)$

V_p

$v(t)^2$

V_p^2

average $= V_p^2$

$V_{rms} = V_p$
Same for DC

How about AC + DC ?

$v(t)$

Vp

V_{DC}

$$V_{rms} = \sqrt{\frac{1}{T} \cdot \int_0^T (v(t))^2 \, dt}$$

$$= \sqrt{\frac{1}{T} \cdot \int_0^T \left(V_p \cdot \cos(\omega \cdot t) + V_{DC}\right)^2 dt}$$

$$= \sqrt{\frac{1}{T} \cdot \int_0^T \left[\left(V_p \cdot \cos(\omega \cdot t)\right)^2 + 2 \cdot \left(V_p \cdot \cos(\omega \cdot t)\right) \cdot V_{DC} + V_{DC}^2\right] dt}$$

$$= \sqrt{\frac{1}{T} \cdot \int_0^T \left(V_p \cdot \cos(\omega \cdot t)\right)^2 dt + \frac{1}{T} \cdot \int_0^T 2 \cdot \left(V_p \cdot \cos(\omega \cdot t)\right) \cdot V_{DC} \, dt + \frac{1}{T} \cdot \int_0^T V_{DC}^2 \, dt}$$

- - - zero over one period - - -

$$= \sqrt{V_{rmsAC}^2 + 0 + V_{DC}^2} \qquad = \sqrt{V_{rmsAC}^2 + V_{DC}^2}$$
$$V_{ra} = \frac{1}{T} \cdot \int_0^T |v(t)| \, dt$$

rectified average

sinusoid:

$$V_{rms} = \frac{V_p}{\sqrt{2}} \qquad I_{rms} = \frac{I_p}{\sqrt{2}}$$

$$V_{ra} = \frac{2}{\pi} \cdot V_p \qquad I_{ra} = \frac{2}{\pi} \cdot I_p$$

triangular:

$$V_{rms} = \frac{V_p}{\sqrt{3}} \qquad I_{rms} = \frac{I_p}{\sqrt{3}}$$

$$V_{ra} = \frac{1}{2} \cdot V_p \qquad I_{ra} = \frac{1}{2} \cdot I_p$$

square:

$$V_{rms} = V_p \qquad I_{rms} = I_p$$
$$V_{ra} = V_{rms} = V_p \qquad I_{ra} = I_{rms} = I_p$$

Most AC meters don't measure true RMS. Instead, they measure V_{ra}, display $1.11 V_{ra}$, and call it RMS. That works for sine waves but not for any other waveform.

waveform + DC $V_{rms} = \sqrt{V_{rmsAC}^2 + V_{DC}^2}$

Some waveforms don't fall into these forms, then you have to perform the math from scratch

For waveform shown

The average DC (V_{DC}) value

$$\frac{2 \cdot V \cdot (4 \cdot ms) + (-5 \cdot V) \cdot (2 \cdot ms)}{6 \cdot ms} = -0.333 \cdot V$$

The RMS (effective) value

Graphical way

$$\frac{4 \cdot V^2 \cdot (4 \cdot ms) + 25 \cdot V^2 \cdot (2 \cdot ms)}{6 \cdot ms} = 11 \cdot V^2$$

$$V_{RMS} := \sqrt{11 \cdot V^2} \qquad V_{RMS} = 3.32 \cdot V$$
OR...

$$V_{RMS} = \sqrt{\frac{1}{T} \cdot \int_0^T (v(t))^2 \, dt}$$

$$= \sqrt{\frac{1}{6 \cdot ms} \cdot \left[\int_{0 \cdot ms}^{4 \cdot ms} (2 \cdot V)^2 \, dt + \int_{2 \cdot ms}^{6 \cdot ms} (-5 \cdot V)^2 \, dt \right]} \qquad = \sqrt{\frac{1}{6 \cdot ms} \cdot \left[4 \cdot ms \cdot (2 \cdot V)^2 + 2 \cdot ms \cdot (-5 \cdot V)^2 \right]} = 3.32 \cdot V$$

The voltage is hooked to a resistor, as shown, for 6 seconds.

The energy is transfered to the resistor during that 6 seconds:

$$R_L := 50 \cdot \Omega$$

$$P_L := \frac{V_{RMS}^2}{R_L} \qquad P_L = 0.22 \cdot W$$

$$W_L := P_L \cdot 6 \cdot sec \qquad W_L = 1.32 \cdot joule \quad \text{All converted to heat}$$

$$P = I_{Rrms}^2 \cdot R = \frac{V_{Rrms}^2}{R} \qquad \text{for Resistors ONLY ! !}$$

Capacitors and Inductors
Average power is ZERO $P = 0$ Average power is ZERO $P = 0$

Capacitors and Inductors DO NOT dissipate (real) average power.

Reactive power is negative   Reactive power is positive

$$Q_C = -I_{Crms} \cdot V_{Crms}$$ $$Q_L = I_{Lrms} \cdot V_{Lrms}$$

$$= -I_{Crms}^2 \cdot \frac{1}{\omega \cdot C} = -V_{Crms}^2 \cdot \omega \cdot C$$ $$= I_{Lrms}^2 \cdot \omega \cdot L = \frac{V_{Lrms}^2}{\omega \cdot L}$$

If current and voltage are not in phase, only the in-phase part of the current matters for the power-- DOT PRODUCT
"Lagging" power

Inductor dominates
"Leading" Power

Capacitor dominates

$$P = I_{Rrms}^2 \cdot R = \frac{V_{Rrms}^2}{R} \quad \text{for resistors} \quad \text{-/\/\/-}$$

other wise....

$$P = V_{rms} \cdot I_{rms} \cdot \cos(\theta) = I_{rms}^2 \cdot |Z| \cdot \cos(\theta) = \frac{V_{rms}^2}{|Z|} \cdot \cos(\theta) \qquad \text{units: watts, kW, MW, etc.}$$

$$P = \text{"Real" Power (average)} = V_{rms} \cdot I_{rms} \cdot pf = I_{rms}^2 \cdot |Z| \cdot pf = \frac{V_{rms}^2}{|Z|} \cdot pf$$

Reactive Power

—| |— capacitors -> - Q $\qquad Q_C = I_{Crms}^2 \cdot X_C = \frac{V_{Crms}^2}{X_C} \qquad\qquad X_C = -\frac{1}{\omega \cdot C} \quad \text{and is a negative number}$

ooo inductors -> + Q $\qquad Q_L = I_{Lrms}^2 \cdot X_L = \frac{V_{Lrms}^2}{X_L} \qquad\qquad X_L = \omega \cdot L \quad \text{and is a positive number}$

other wise....

$$Q = \text{Reactive "power"} = V_{rms} \cdot I_{rms} \cdot \sin(\theta) \qquad\qquad \text{units: VAR, kVAR, etc.   "volt-amp-reactive"}$$

Complex and Apparent Power

complex congugate

$$S = \text{Complex "power"} = V_{rms} \cdot \overline{I_{rms}} = P + jQ = V_{rms}I_{rms} \underline{/\theta} \qquad \text{units: VA, kVA, etc.   "volt-amp"}$$

$$\textbf{NOT} \quad I_{rms}^2 \cdot Z \quad \textbf{NOR} \quad \frac{V_{rms}^2}{Z}$$

$$S = \text{Apparent "power"} = |S| = V_{rms} \cdot I_{rms} = \sqrt{P^2 + Q^2} \qquad \text{units: VA, kVA, etc.   "volt-amp"}$$

Power factor

$$pf = \cos(\theta) = \text{power factor (sometimes expressed in \%)} \quad 0 \le pf \le 1$$

θ is the **phase angle** between the voltage and the current or the phase angle of the impedance. $\theta = \theta_Z$

$\theta < 0$ Load is "Capacitive", power factor is "leading". This condition is very rare

$\theta > 0$ Load is "Inductive", power factor is "lagging". This condition is so common you can assume any power factor given is lagging unless specified otherwise. Transformers and motors make most loads inductive.

Industrial users are charged for the reactive power that they use, so power factor < 1 is a bad thing.

Power factor < 1 is also bad for the power company. To deliver the same power to the load, they have more line current (and thus more line losses).

Power factors are "corrected" by adding capacitors (or capacitve loads) in parallel with the inductive loads which cause the problems. (In the rare case that the load is capacitive, the pf would be corrected by an inductor.)

"Lagging" power

"Leading" Power
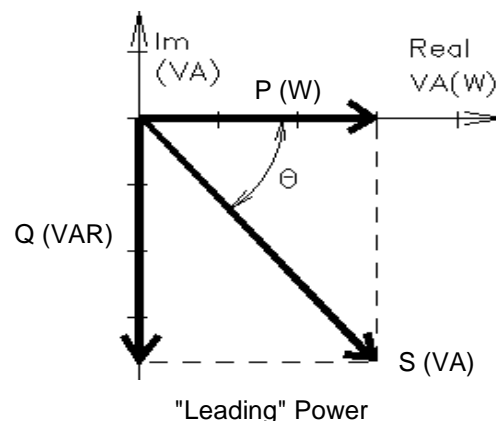

A Transformer is two coils of wire that are magnetically coupled.

Transformers are only useful for AC, which is one of the big reasons electrical power is generated and distributed as AC.

Transformer turns and turns ratios are rarely given, V_p/V_s is much more common where V_p/V_s is the rated primary over rated secondary voltages. You may take this to be the same as N_1/N_2 although in reality N_2 is usually a little bit bigger to make up for losses. Also common: $V_p : V_s$.

Both RMS

Transformers are rated in VA   Transformer Rating (VA) = (rated V) x (rated I) , on either side.
   Don't allow voltages over the rated V , regardless of the actual current.
   Don't allow currents over the rated I , regardless of the actual voltage.

Ideal Transformers

Iron-core transformer
primary   secondary

Ideal: $P_1 = P_2$

power in = power out

(Ryff, Fig.7.2)

common

rare

Transformation of voltage and current

$$\frac{N_1}{N_2} = \frac{V_1}{V_2} = \frac{I_2}{I_1}$$

Turns ratio

   Turns ratio as defined in Chapman text: $a = \dfrac{N_1}{N_2}$, same as $N = \dfrac{N_1}{N_2}$

Note: some other texts define the turns ratio as: $\dfrac{N_2}{N_1}$

Be careful how you and others use this term

Transformation of impedance
You can replace the entire transformer and load with (Z_{eq}). This "impedance transformation" can be very handy.

Transformers can be used for "impedance matching"

$$Z_{eq} = N^2 \cdot Z_2 = \left(\frac{N_1}{N_2}\right)^2 \cdot Z_2$$

This also works the opposite way, to move an impedance from the primary to the secondary, multiply by: $\left(\dfrac{N_2}{N_1}\right)^2$

Multi-tap transformers: Many transformers have more than two connections to primary and/or the secondary. The extra connections are called "taps" and may allow you to select from several different voltages or get more than one voltage at the same time.

Isolation Transformers: Allmost all transformers isolate the primary from the secondary. An Isolation transformer has a 1:1 turns ratio and is just for isolation.

Auto Transformers: Auto transformers have only one winding with taps for various voltages. The primary and secondary are simply parts of the same winding. These parts may overlap. Any regular transformer can be wired as an auto transformer.   Auto transformers DO NOT provide isolation.

Vari-AC: A special form of auto transformer with an adjustable tap for an adjustable output voltage.

LVDT A Linear-Variable-Differential-Transformers has moveable core which couples the primary winding to the secondary winding(s) in such a way the the secondary voltage is proportional to the position of the core. LVDTs are used as position sensors.

Home power

Standard 120 V outlet connections are shown at right.

The 3 lines coming into your house are **NOT** 3-phase. They are +120 V, Gnd, -120 V

(The two 120s are 180º out-of-phase, allowing for 240 V connections)

Neutral, N
white
(also ground)

Line, L
black, 120V

Ground, G, green
3-Phase Power (FYI ONLY)

Single phase power pulses at 120 Hz. This is not good for motors or generators over 5 hp.

Three phase power is constant as long as the three loads are balanced.

Three lines are needed to transmit 3-phase power. If loads are balanced, ground return current will be zero.

phase 2—
phase 3—
