

### The z - transform

The z - transform will help us deal with discrete-time (digital) signals just like the Laplace transform helped us with continuous-time signals. So let's start making a table.

z - transform: 
$$F(z) = \sum_{k=0}^{\infty} f(k) \cdot z^{-k}$$

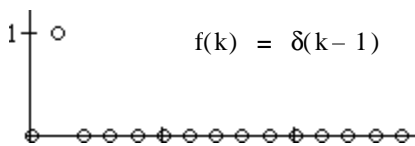

#### Impulse

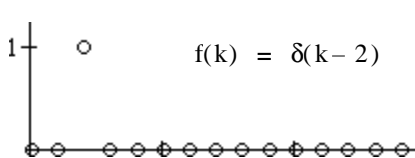

$f(k) = \delta(k)$       $F(z) = \sum_{k=0}^{\infty} \delta(k) \cdot z^{-k} = 1 + 0 + 0 + 0 + \dots$

$F(z) = 1$      no pole  
Just like Laplace:  
 $f(t) = \delta(t)$      &      $F(s) = 1$

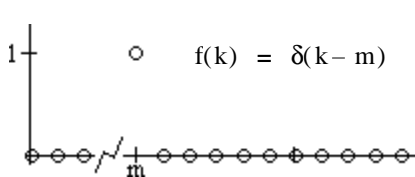

#### Delayed Impulses

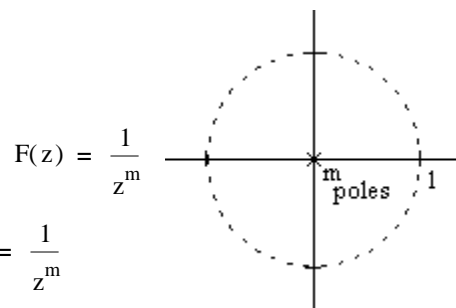

$f(k) = \delta(k-1)$       $F(z) = \sum_{k=0}^{\infty} \delta(k-1) \cdot z^{-k} = 0 + \frac{1}{z} + 0 + 0 + \dots$       $F(z) = \frac{1}{z}$

$f(k) = \delta(k-2)$       $F(z) = \sum_{k=0}^{\infty} \delta(k-2) \cdot z^{-k} = 0 + 0 + \frac{1}{z^2} + 0 + \dots$       $F(z) = \frac{1}{z^2}$

$f(k) = \delta(k-m)$       $F(z) = \sum_{k=0}^{\infty} \delta(k-m) \cdot z^{-k}$   
 $= 0 + \dots + 0 + \frac{1}{z^m} + 0 + 0 + \dots = \frac{1}{z^m}$

Any finite-length signal can be made of delayed impulses, so all its poles are at the origin.

$$\text{SUM} = \sum_{k=0}^n \alpha^k = 1 + \alpha + \alpha^2 + \alpha^3 + \alpha^4 + \dots + \alpha^n$$

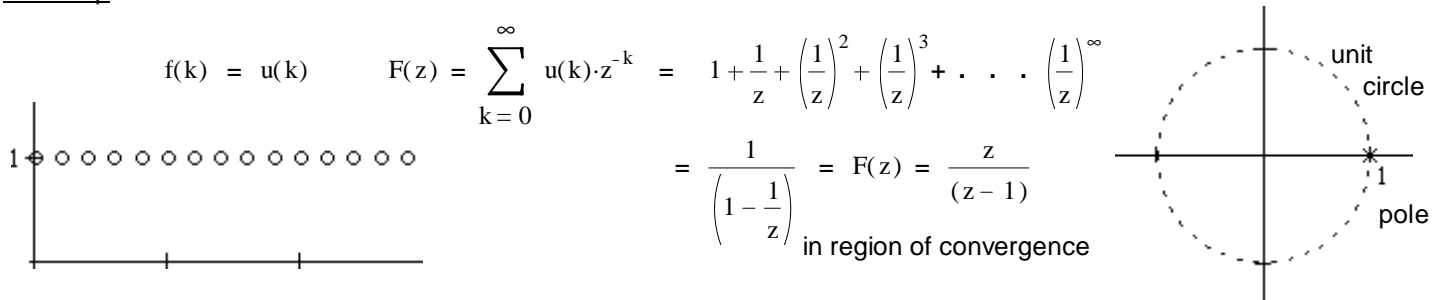

$$\begin{aligned} \text{SUM} \cdot (1 - \alpha) &= (1 - \alpha) (1 + \alpha + \alpha^2 + \alpha^3 + \alpha^4 + \dots + \alpha^n) \\ &= 1 (1 + \alpha + \alpha^2 + \alpha^3 + \alpha^4 + \dots + \alpha^n) - \alpha (1 + \alpha + \alpha^2 + \alpha^3 + \alpha^4 + \dots + \alpha^n) \\ &= 1 (1 + \alpha + \alpha^2 + \alpha^3 + \alpha^4 + \dots + \alpha^n) \\ &\quad - (\alpha + \alpha^2 + \alpha^3 + \alpha^4 + \alpha^5 + \dots + \alpha^n + \alpha^{n+1}) \\ &= \frac{1 - \alpha^{n+1}}{1 - \alpha} \end{aligned}$$

$$\text{SUM} \cdot (1 - \alpha) = 1 - \alpha^{n+1}$$

$$\text{SUM} = \frac{1 - \alpha^{n+1}}{(1 - \alpha)} \quad \text{if } n = \infty \quad \text{SUM} = \sum_{k=0}^{\infty} \alpha^k = \frac{1 - \alpha^{\infty+1}}{(1 - \alpha)} = \frac{1}{(1 - \alpha)} \quad \text{if } (\alpha < 1)$$

in region of convergence ( $\alpha < 1$ )

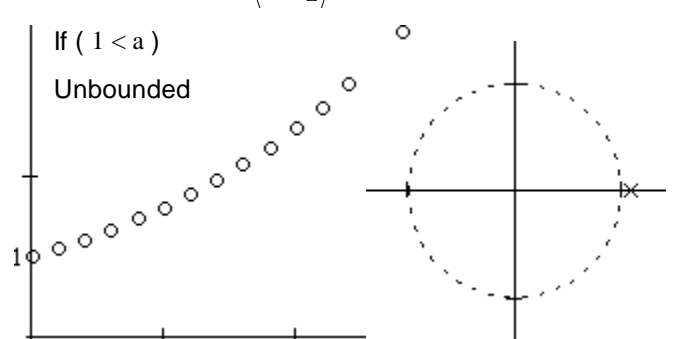

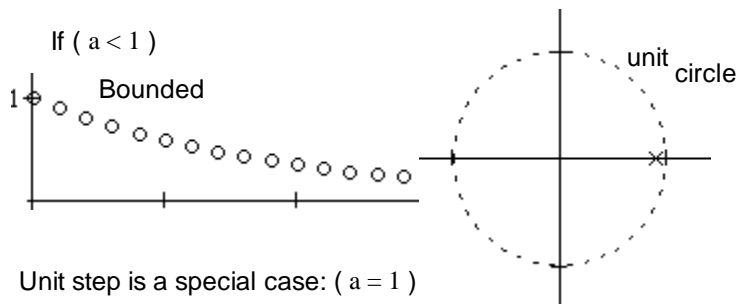

Unit Step

Like Laplace:  
 $f(t) = u(t)$  &  $F(s) = \frac{1}{s}$

Geometric Progression

$$f(k) = a^k \cdot u(k) \quad F(z) = \sum_{k=0}^{\infty} a^k \cdot z^{-k} = 1 + \frac{a}{z} + \left(\frac{a}{z}\right)^2 + \left(\frac{a}{z}\right)^3 + \dots + \left(\frac{a}{z}\right)^{\infty} = \frac{1}{\left(1 - \frac{a}{z}\right)} = F(z) = \frac{z}{(z - a)}$$

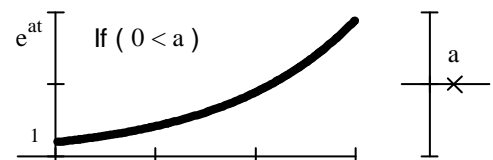

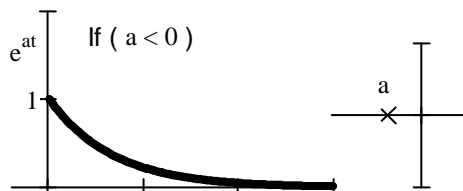

Unit step is a special case: ( $a = 1$ )

Like Laplace exponentials

$$f(t) = e^{at} \cdot u(t)$$

$$F(s) = \frac{1}{s - a}$$

$$f(k) = (C_1 \cdot a_1^k + C_2 \cdot a_2^k) \cdot u(k) \quad F(z) = C_1 \cdot \frac{z}{z - a_1} + C_2 \cdot \frac{z}{z - a_2} \quad \text{Linearity}$$

Sinusoidals

If  $C_2 = \overline{C_1}$  <sup>complex conjugate</sup> and  $a_2 = \overline{a_1}$  and we'll now call  $C_1 = C$  and  $a_1 = p$

Then  $f(k) = [C \cdot p^k + \overline{C} \cdot (\overline{p})^k] \cdot u(k)$  and  $F(z) = C \cdot \frac{z}{z - p} + \overline{C} \cdot \frac{z}{z - \overline{p}}$

$$\begin{aligned} f(k) &= [C \cdot p^k + \overline{C} \cdot (\overline{p})^k] \cdot u(k) \\ &= [|C| \cdot e^{j\theta} \cdot (|p|)^k \cdot e^{j\theta} p^k + |C| \cdot e^{-j\theta} \cdot (|p|)^k \cdot e^{-j\theta} \overline{p}^k] \cdot u(k) \\ &= |C| \cdot (|p|)^k \cdot [e^{j(\theta_C + \theta_p k)} + e^{-j(\theta_C + \theta_p k)}] \cdot u(k) \\ &= 2 \cdot |C| \cdot (|p|)^k \cdot \left[ \frac{e^{j(\theta_p k + \theta_C)} + e^{-j(\theta_p k + \theta_C)}}{2} \right] \cdot u(k) \\ &= 2 \cdot |C| \cdot (|p|)^k \cdot \cos(\theta_p \cdot k + \theta_C) \cdot u(k) \end{aligned}$$

2 complex-conjugate poles at  $p$  and  $\overline{p}$

Recall Euler's eq.:  $\cos(\theta \cdot t) = \frac{e^{j\theta t} + e^{-j\theta t}}{2}$

If  $C$  is real ( $\theta_C = 0$ )

$$f(k) = 2 \cdot C \cdot (|p|)^k \cdot \cos(\theta_p \cdot k) \cdot u(k)$$

$$F(z) = \frac{C \cdot z \cdot [(z - \overline{p}) + (z - p)]}{(z - p) \cdot (z - \overline{p})} = \frac{C \cdot z \cdot (2z - \overline{p} - p)}{z^2 - z(\overline{p} + p) + p \cdot \overline{p}}$$

$$\begin{aligned} \overline{p} + p &= |p| \cdot \cos(\theta_p) - j \cdot |p| \cdot \sin(\theta_p) + |p| \cdot \cos(\theta_p) + j \cdot |p| \cdot \sin(\theta_p) \\ &= |p| \cdot \cos(\theta_p) + |p| \cdot \cos(\theta_p) = 2 \cdot |p| \cdot \cos(\theta_p) \end{aligned}$$

$$F(z) = \frac{2 \cdot C \cdot z \cdot (z - |p| \cdot \cos(\theta_p))}{z^2 - z \cdot (2 \cdot |p| \cdot \cos(\theta_p)) + p \cdot \overline{p}}$$

This leads directly to (let  $C=1/2$ ):

$$\text{If } f(k) = (|p|)^k \cdot \cos(\theta_p \cdot k) \cdot u(k)$$

$$F(z) = \frac{z \cdot (z - |p| \cdot \cos(\theta_p))}{z^2 - 2 \cdot |p| \cdot \cos(\theta_p) \cdot z + (|p|)^2}$$

And if  $|p| = 1$  (poles are right in the unit circle)

$$f(k) = \cos(\theta_p \cdot k) \cdot u(k)$$

$$F(z) = \frac{z \cdot (z - \cos(\theta_p))}{z^2 - 2 \cdot \cos(\theta_p) \cdot z + 1} \quad \text{Then sometimes } \theta_p \text{ is replaced by } \Omega_0$$

If  $C$  is  $-j|C|$ , imaginary ( $\theta_C = -90^\circ$ ) ( $\overline{C} = j \cdot |C|$ )

$$f(k) = 2 \cdot (|p|)^k \cdot \sin(\theta_p \cdot k) \cdot u(k)$$

$$\begin{aligned} F(z) &= \frac{-j \cdot |C| \cdot z \cdot (z - \overline{p}) + j \cdot |C| \cdot z \cdot (z - p)}{(z - p) \cdot (z - \overline{p})} \\ &= \frac{|C| \cdot z \cdot (-j \cdot z + j \cdot z + j \cdot \overline{p} - j \cdot p)}{z^2 - 2 \cdot |p| \cdot \cos(\theta_p) \cdot z + (|p|)^2} \end{aligned}$$

$$\begin{aligned} \overline{p} - j \cdot p &= (j \cdot |p| \cdot \cos(\theta_p) - j \cdot j \cdot |p| \cdot \sin(\theta_p)) - j \cdot |p| \cdot \cos(\theta_p) - j \cdot j \cdot |p| \cdot \sin(\theta_p) \\ &= j \cdot |p| \cdot \cos(\theta_p) + |p| \cdot \sin(\theta_p) - j \cdot |p| \cdot \cos(\theta_p) + |p| \cdot \sin(\theta_p) \end{aligned}$$

$$F(z) = \frac{z \cdot (2 \cdot |p| \cdot \sin(\theta_p))}{z^2 - 2 \cdot |p| \cdot \cos(\theta_p) \cdot z + (|p|)^2}$$

# ECE 3510 Discrete p4

## Sinusoidals

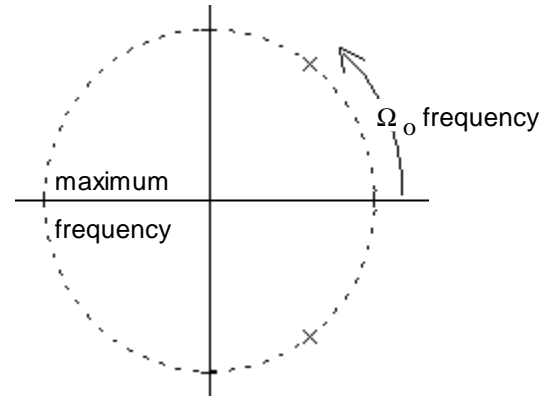

$$f(k) = \cos(\Omega_0 \cdot k) \cdot u(k)$$

AND

$$f(k) = \sin(\Omega_0 \cdot k) \cdot u(k)$$

$$F(z) = \frac{z(z - \cos(\Omega_0))}{z^2 - 2 \cdot \cos(\Omega_0) \cdot z + 1}$$

$$F(z) = \frac{z \cdot \sin(\Omega_0)}{z^2 - 2 \cdot \cos(\Omega_0) \cdot z + 1}$$

## Sinusoidals with growth or decay

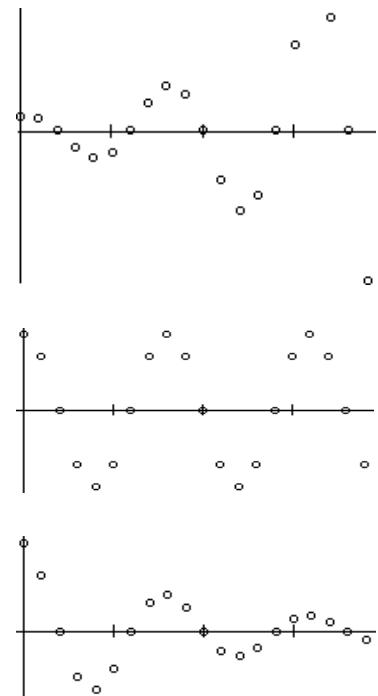

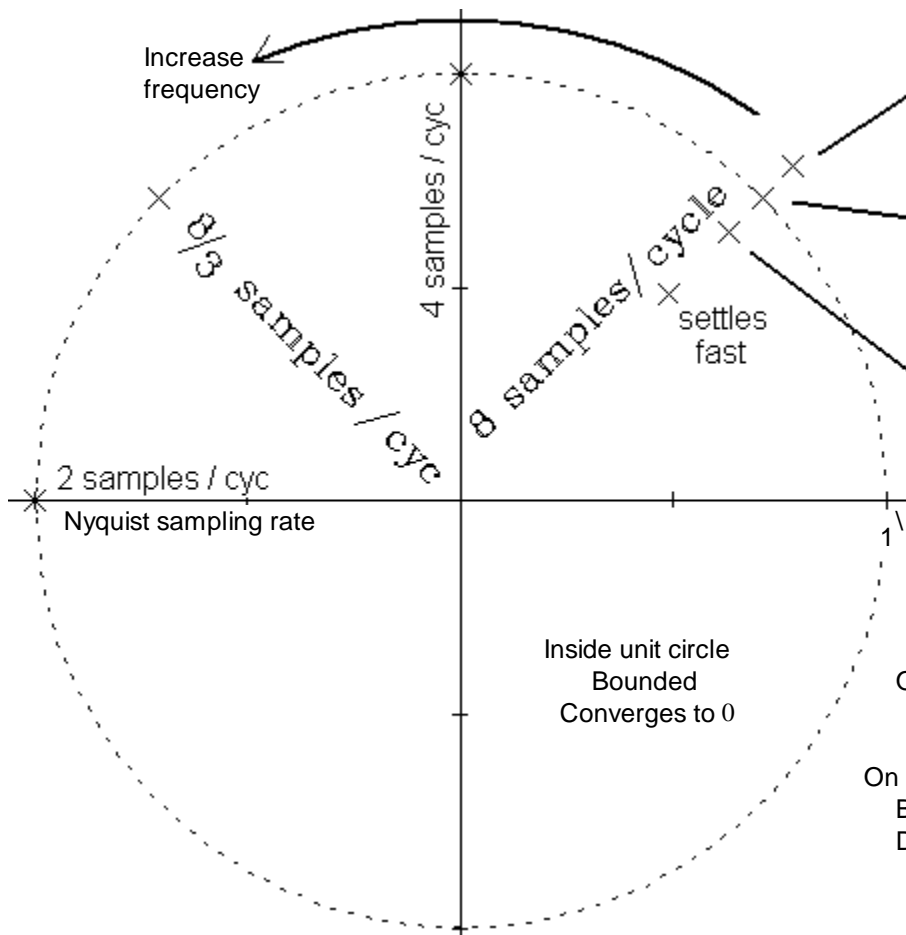

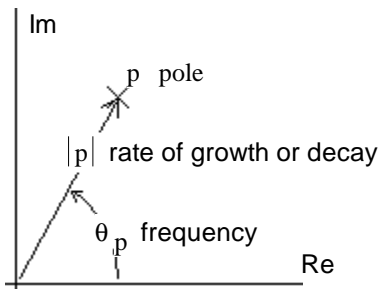

$$f(k) = |p|^k \cdot \cos(\theta_p \cdot k) \cdot u(k)$$

AND

$$f(k) = (|p|)^k \cdot \sin(\theta_p \cdot k) \cdot u(k)$$

$$F(z) = \frac{z \cdot (z - |p| \cdot \cos(\theta_p))}{z^2 - 2 \cdot |p| \cdot \cos(\theta_p) \cdot z + (|p|)^2}$$

$$F(z) = \frac{z \cdot (|p| \cdot \sin(\theta_p))}{z^2 - 2 \cdot |p| \cdot \cos(\theta_p) \cdot z + (|p|)^2}$$

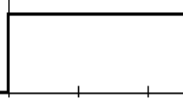

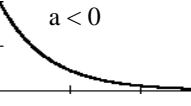

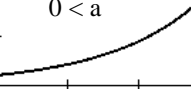

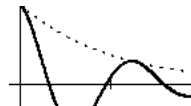

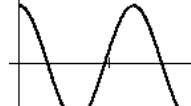

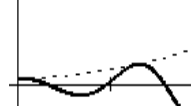

Converges to a nonzero value

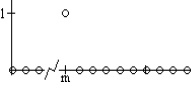

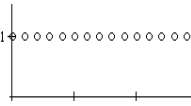

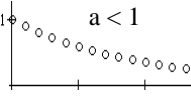

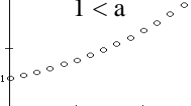

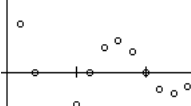

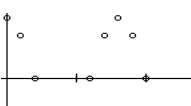

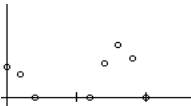

Outside unit circle  
Unbounded, doesn't converge

On unit circle  
Bounded unless dbl poles  
Doesn't converge except if pole at 1

## Laplace Transform (Unilateral)

	$f(t)$	$F(s)$	pole

Partial Fraction Expansion

a

**Ex.1**  $F(z) = \frac{1}{(z-1)(z+1)}$  Example 1 from Bodson, page 197

Divide by z first, because all the table entries have a z in the numerator, you can remultiply by z at the end.

$$\frac{F(z)}{z} = \frac{1}{z \cdot (z-1) \cdot (z+1)} = \frac{A}{z} + \frac{B}{(z-1)} + \frac{C}{z+1}$$

Multiply both sides by:  $z \cdot (z-1) \cdot (z+1)$

$$1 = A \cdot (z-1) \cdot (z+1) + B \cdot z \cdot (z+1) + C \cdot z \cdot (z-1)$$

Set  $z := 0$

$$1 = A \cdot (0-1) \cdot (0+1) + 0 + 0 \quad A := \frac{1}{-1} \quad A = -1$$

Set  $z := 1$

$$1 = 0 + B \cdot 1 \cdot (1+1) + 0 \quad B := \frac{1}{2} \quad B = 0.5$$

Set  $z := -1$

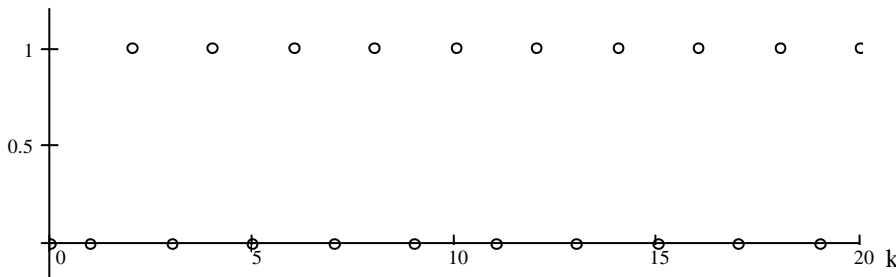

$$1 = 0 + 0 + C \cdot (-1) \cdot (-1-1) \quad C := \frac{1}{2} \quad C = 0.5$$

$$\frac{F(z)}{z} = \frac{1}{z \cdot (z-1) \cdot (z+1)} = \frac{-1}{z} + \frac{1}{2} \cdot \frac{1}{(z-1)} + \frac{1}{2} \cdot \frac{1}{z+1}$$

Now multiply back through by z to get partial fractions that can actually be found in the table.

$$F(z) = \frac{1}{(z-1)(z+1)} = \frac{-1 \cdot z}{z} + \frac{1}{2} \cdot \frac{z}{(z-1)} + \frac{1}{2} \cdot \frac{z}{z+1}$$

$$f(k) := \left[ -1 \cdot \delta(k) + \frac{1}{2} + \frac{1}{2} \cdot (-1)^k \right] \cdot u(k)$$

By long division, as shown in section 6.3.2 in Bodson text.

$$(z-1) \cdot (z+1) = (z^2 - 1)$$

$$\begin{array}{r} z^{-2} + z^{-4} + z^{-6} + \dots \\ (z^2 - 1) \overline{) 1} \\ \underline{1 - z^{-2}} \\ z^{-2} \\ \underline{z^{-2} - z^{-4}} \\ z^{-4} \\ \underline{z^{-4} - z^{-6}} \\ z^{-6} \text{ etc} \end{array}$$

never ends

**Ex.2**  $F(z) = \frac{z}{(z - 0.9)^2 \cdot (z + 0.8)}$

$$\frac{F(z)}{z} = \frac{1}{(z - 0.9)^2 \cdot (z + 0.8)} = \frac{A}{z - 0.9} + \frac{0.9 \cdot B}{(z - 0.9)^2} + \frac{C}{z + 0.8}$$

Multiply both sides by:  $(z - 0.9)^2 \cdot (z + 0.8)$

$$1 = A \cdot (z - 0.9) \cdot (z + 0.8) + 0.9 \cdot B \cdot (z + 0.8) + C \cdot (z - 0.9)^2$$

Set  $z := 0.9$

$$1 = 0 + 0.9 \cdot B \cdot (0.9 + 0.8) + 0$$

$$B := \frac{1}{0.9 \cdot 1.7}$$

$$B = 0.654$$

Set  $z := -0.8$

$$1 = 0 + 0 + C \cdot (-0.8 - 0.9)^2$$

$$(-1.7)^2$$

$$C := \frac{1}{(-1.7)^2}$$

$$C = 0.346$$

Back to equation above

$$1 = A \cdot (z + 0.9) \cdot (z + 0.8) + 0.9 \cdot B \cdot (z + 0.8) + C \cdot (z + 0.9)^2$$

$$1 = A \cdot z^2 + 1.7 \cdot A \cdot z + .72 \cdot A + 0.9 \cdot B \cdot z + 0.72 \cdot B + C \cdot z^2 + 1.8 \cdot C \cdot z + .81 \cdot C$$

$$0 \cdot z^2 = A \cdot z^2 + 0 + C \cdot z^2$$

$$A := -C$$

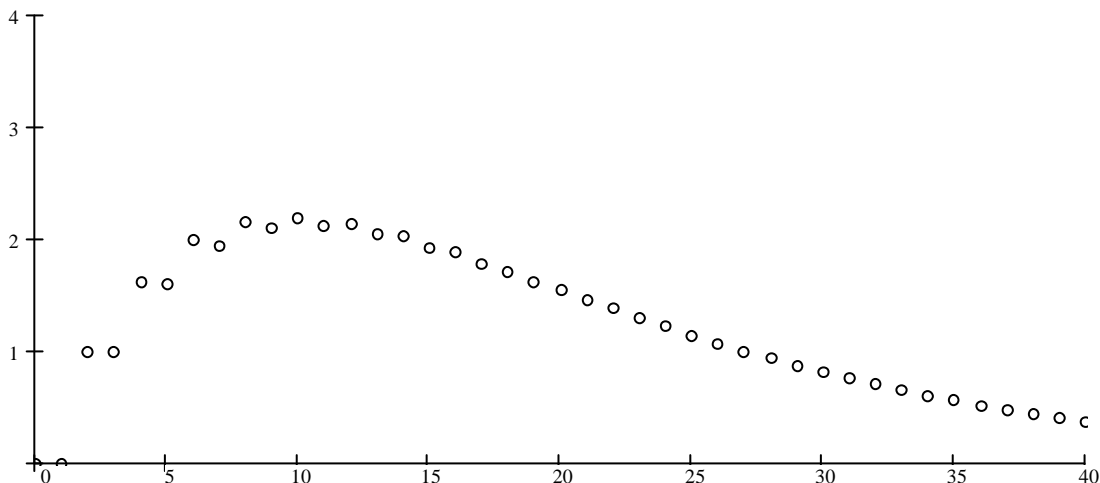

$$A = -0.346$$

no  $z^2$  term on the left

$$F(z) = \frac{z}{(z - 0.9)^2 \cdot (z + 0.8)} = \frac{-0.346 \cdot z}{z - 0.9} + \frac{0.654 \cdot 0.9 \cdot z}{(z - 0.9)^2} + \frac{0.346 \cdot z}{z + 0.8}$$

$$f(k) = -0.346 \cdot (0.9)^k + 0.654 \cdot k \cdot (0.9)^k + 0.346 \cdot (-0.8)^k$$

$$f(k) := [-0.346 \cdot (0.9)^k + 0.654 \cdot k \cdot (0.9)^k + 0.346 \cdot (-0.8)^k] \cdot u(k) \quad k := 0, 1 \dots 40$$

**Ex.3**  $F(z) = \frac{z}{z^2 - 2 \cdot z + 2}$

The complex coefficient way (not recommended)

$$\frac{F(z)}{z} = \frac{1}{(z - (1+j)) \cdot (z - (1-j))} = \frac{A}{(z - (1+j))} + \frac{B}{(z - (1-j))}$$

$$\frac{1}{(z - (1-j))} \Big|_{z = (1+j)} = A = \frac{1}{((1+j) - (1-j))} = -0.5j$$

$$\frac{1}{(z - (1+j))} \Big|_{z = 1-j} = B = \frac{1}{((1-j) - (1+j))} = 0.5j$$

$$p := (1+j) \quad |p| = \sqrt{2} \quad \angle p = \theta_p = \frac{\pi}{4}$$

$$c = -\frac{1}{2} \cdot j \quad |c| = \frac{1}{2} \quad \angle c = \theta_c = -\frac{\pi}{2}$$

Use this Table entry  $\frac{C \cdot z}{(z - p)} + \frac{\bar{C} \cdot z}{(z - \bar{p})} \leftrightarrow 2 \cdot |C| \cdot (|p|)^k \cdot \cos(\theta_p \cdot k + \theta_C)$  Note: table shows B, where I've changed to C for clarity here

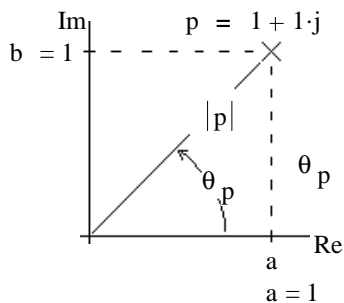

$$f(k) = 2 \cdot |c| \cdot (|p|)^k \cdot \cos(\theta_p \cdot k + \theta_c) = 2 \cdot \frac{1}{2} \cdot (\sqrt{2})^k \cdot \cos\left(\frac{\pi}{4} \cdot k - \frac{\pi}{2}\right) \cdot u(k) = (\sqrt{2})^k \cdot \sin\left(\frac{\pi}{4} \cdot k\right) \cdot u(k)$$

The easy way

$$(|p|)^k \cdot \cos(\theta_p \cdot k) \leftrightarrow \frac{z \cdot (z - a)}{z^2 - 2 \cdot a \cdot z + (a^2 + b^2)} = \frac{z \cdot (z - |p| \cdot \cos(\theta_p))}{z^2 - 2 \cdot |p| \cdot \cos(\theta_p) \cdot z + (|p|)^2}$$

$$(|p|)^k \cdot \sin(\theta_p \cdot k) \leftrightarrow \frac{z \cdot b}{z^2 - 2 \cdot a \cdot z + (a^2 + b^2)} = \frac{z \cdot (|p| \cdot \sin(\theta_p))}{z^2 - 2 \cdot |p| \cdot \cos(\theta_p) \cdot z + (|p|)^2}$$

Fit to our denominator:  $z^2 - 2 \cdot z + 2$   
 $a := 1 \quad b := \sqrt{2 - a^2} \quad b = 1 \quad |p| = \sqrt{2}$

$|p|$  and  $\theta_p$  are found here, but only needed in the very last step, to find  $f(k)$ .

$$\theta_p = \arccos\left(\frac{1}{\sqrt{2}}\right) = 0.785 = \frac{\pi}{4}$$

Continue partial fraction expansion

$$\frac{F(z)}{z} = \frac{1}{z^2 - 2 \cdot z + 2} = \frac{A(z - 1)}{z^2 - 2 \cdot z + 2} + \frac{B(1)}{z^2 - 2 \cdot z + 2} \quad \text{Let: } z = 1 \quad B := 1$$

$$1 = A(z - 1) + B$$

$$0 \cdot z = A \cdot z \quad A := 0$$

$|p|$  and  $\theta_p$  are needed here, to find  $f(k)$ .  $f(k) = A \cdot (|p|)^k \cdot \cos(\theta_p \cdot k) \cdot u(k) + B \cdot (|p|)^k \cdot \sin(\theta_p \cdot k) \cdot u(k)$

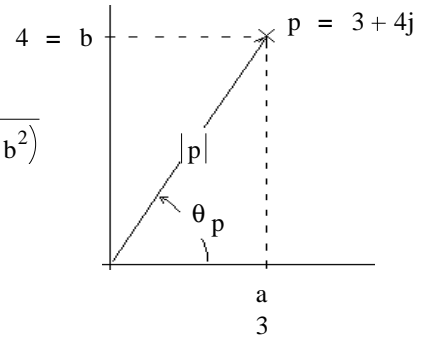

$$f(k) = (\sqrt{2})^k \cdot \sin\left(\frac{\pi}{4} \cdot k\right) \cdot u(k)$$

**Ex.4**

$$F(z) = \frac{2 \cdot z \cdot (3 \cdot z + 17)}{(z - 1) \cdot (z^2 - 6 \cdot z + 25)}$$

$$\begin{aligned} \frac{F(z)}{z} &= \frac{2 \cdot (3 \cdot z + 17)}{(z - 1) \cdot (z^2 - 6 \cdot z + 25)} = \frac{A}{z - 1} + \frac{B \cdot (z - a)}{z^2 - 2 \cdot a \cdot z + (a^2 + b^2)} + \frac{C \cdot b}{z^2 - 2 \cdot a \cdot z + (a^2 + b^2)} \\ &= \frac{A}{z - 1} + \frac{B(z - a)}{z^2 - 6 \cdot z + 25} + \frac{C \cdot b}{z^2 - 6 \cdot z + 25} \end{aligned}$$

$z^2 - 6 \cdot z + 25$   
 $z^2 - 2 \cdot a \cdot z + (a^2 + b^2)$   
 $a := 3 \qquad b := \sqrt{25 - a^2} \qquad b = 4$

$|p|$  and  $\theta_p$  are found here,  $|p| = \sqrt{25} = 5$  but only needed in the very last step, to find  $f(k)$ .  
 $\theta_p = \text{asin}\left(\frac{4}{5}\right) = 0.927 = \text{acos}\left(\frac{3}{5}\right) = 0.927 = \text{atan}\left(\frac{4}{3}\right) = 0.927$  (in radians)  
 several ways to find  $\theta_p$  (in radians)

$$\frac{F(z)}{z} = \frac{2 \cdot (3 \cdot z + 17)}{(z - 1) \cdot (z^2 - 6 \cdot z + 25)} = \frac{A}{z - 1} + \frac{B(z - 3)}{z^2 - 6 \cdot z + 25} + \frac{C \cdot 4}{z^2 - 6 \cdot z + 25}$$

$$\left. \frac{2 \cdot (3 \cdot z + 17)}{(z^2 - 6 \cdot z + 25)} \right|_{z=1} = A = \frac{2 \cdot (3 \cdot 1 + 17)}{(1^2 - 6 \cdot 1 + 25)} = 2$$

$$2 \cdot (3 \cdot z + 17) = A \cdot (z^2 - 6 \cdot z + 25) + B \cdot (z - 3) \cdot (z - 1) + C \cdot 4 \cdot (z - 1)$$

$$6 \cdot z + 34 = 2 \cdot (z^2 - 6 \cdot z + 25) + B \cdot (z^2 - 4 \cdot z + 3) + C \cdot 4 \cdot (z - 1)$$

$$6 \cdot z + 34 = 2 \cdot z^2 - 12 \cdot z + 50 + B \cdot z^2 - 4 \cdot B \cdot z + 3 \cdot B + C \cdot 4 \cdot z - C \cdot 4$$

$$B := -2$$

$$6 \cdot z = -12 \cdot z + 4 \cdot 2 \cdot z + C \cdot 4 \cdot z$$

$$C = \frac{6 + 12 - 8}{4} = 2.5$$

OR  $\frac{34 - 50 + 6}{-4} = 2.5$

$$F(z) = \frac{2 \cdot z \cdot (3 \cdot z + 17)}{(z - 1) \cdot (z^2 - 6 \cdot z + 25)} = \frac{2 \cdot z}{z - 1} + \frac{-2 \cdot z \cdot (z - 3)}{z^2 - 6 \cdot z + 25} + \frac{2.5 \cdot 4}{z^2 - 6 \cdot z + 25}$$

$|p|$  and  $\theta_p$  are needed here, to find  $f(k)$ .

$$\begin{aligned} u(k) & \quad (|p|)^k \cdot \cos(\theta_p \cdot k) & (|p|)^k \cdot \sin(\theta_p \cdot k) \\ f(k) &= 2 \cdot u(k) - 2 \cdot 5^k \cdot \cos(0.927 \cdot k) + 2.5 \cdot 5^k \cdot \sin(0.927 \cdot k) \\ f(k) &= \left( 2 \cdot u(k) - 2 \cdot 5^k \cdot \cos(0.927 \cdot k) + 2.5 \cdot 5^k \cdot \sin(0.927 \cdot k) \right) u(k) \end{aligned}$$

# ECE 3510 Discrete-time Systems & Transfer Functions

A. Stolp  
4/20/20

Section 6.4 in Bodson text (p.200) Follow along in the Textbook

**Ex.1** (\$ I got in bank) = (\$ I had) + interest + (\$ I add)

Define:  $y(k)$  = bank account balance at end of day  $k$

$x(k)$  = money deposited on day  $k$

$\alpha$  = interest earned in one day

$$y(k) = y(k-1) + \alpha \cdot y(k-1) + x(k)$$

$$Y(z) = z^{-1} \cdot Y(z) + \alpha \cdot z^{-1} \cdot Y(z) + X(z)$$

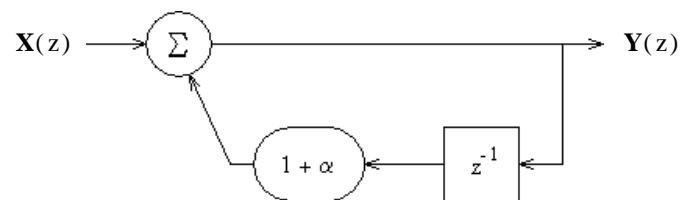

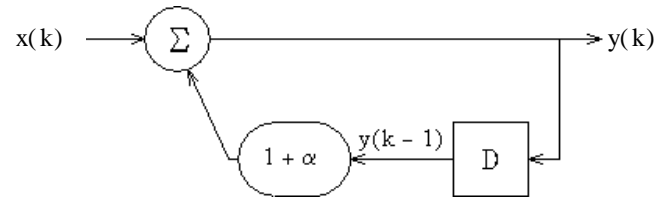

$$= z^{-1} \cdot Y(z) \cdot (1 + \alpha) + X(z)$$

$$Y(z) - z^{-1} \cdot Y(z) \cdot (1 + \alpha) = X(z)$$

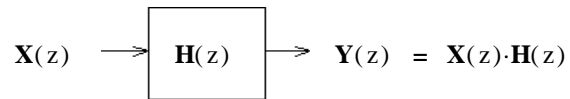

$$Y(z) \cdot [1 - z^{-1} \cdot (1 + \alpha)] = X(z)$$

$$H(z) = \frac{Y(z)}{X(z)} = \frac{1}{[1 - z^{-1} \cdot (1 + \alpha)]} \cdot \frac{z}{z}$$

$$H(z) = \frac{z}{z - (1 + \alpha)}$$

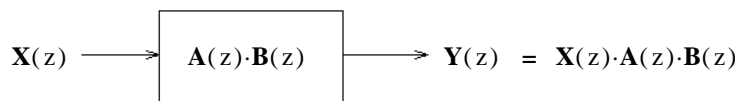

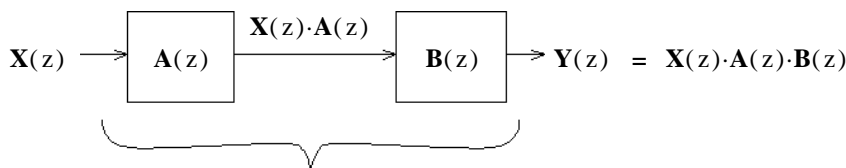

In general:  $H(z) = \frac{\text{output}}{\text{input}} = \frac{Y(z)}{X(z)}$

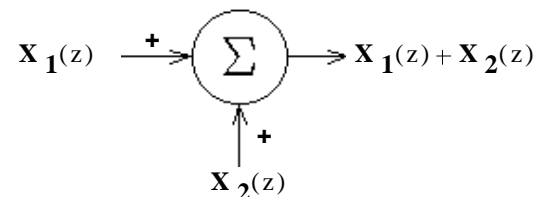

## All Transfer - Function and Block - Diagrams we already know from Laplace work with z-transforms

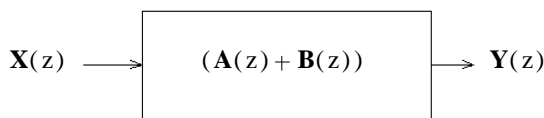

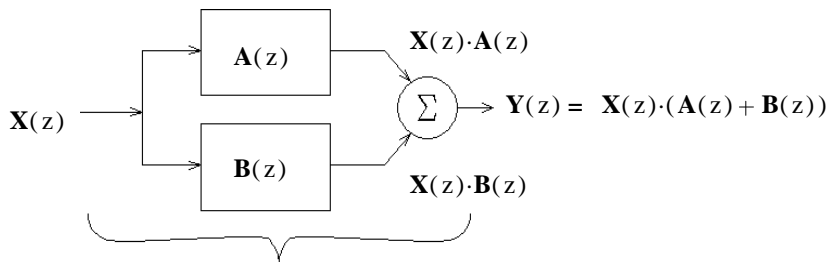

### Serial - path systems

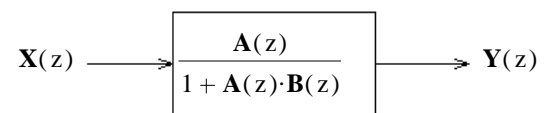

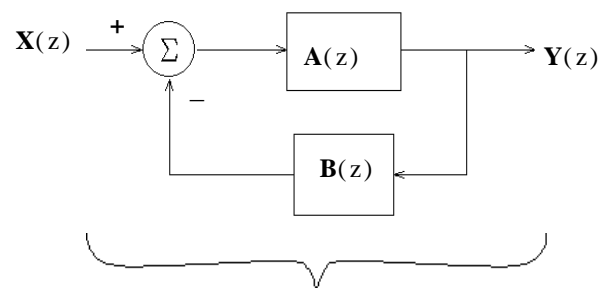

### Summers

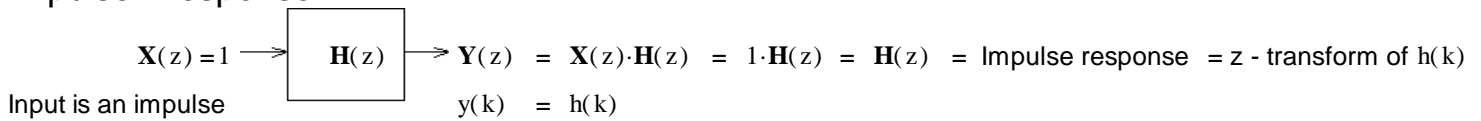

### Parallel - paths

### Feedback loop

## Impulse Response

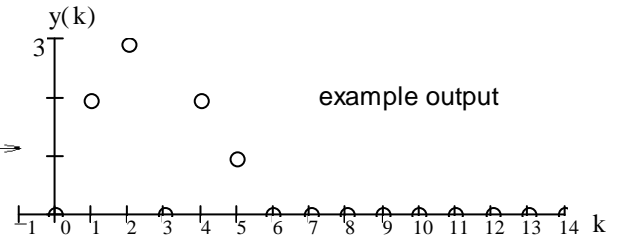

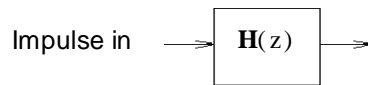

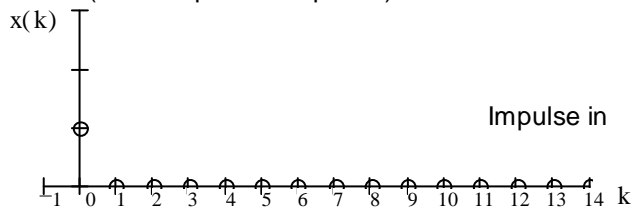

Sometimes the term "impulse response" is used in place of the term "transfer function"

**FIR** Finite Impulse Response (FIR) means that output goes to and stays at absolute 0 within a finite number of steps.

**IIR** Infinite Impulse Response (IIR) means output never completely goes away. (It may approach 0 like exponential decay)

### FIR (Finite Impulse Response)

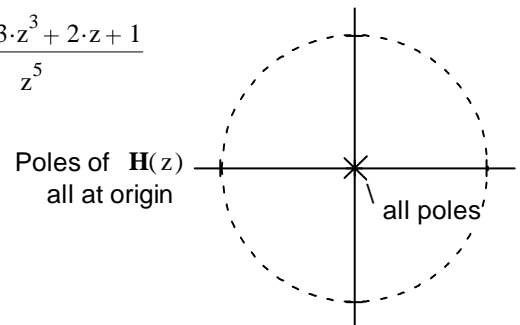

$$y(k) = 2 \cdot x(k-1) + 3 \cdot x(k-2) + 2 \cdot x(k-4) + x(k-5)$$

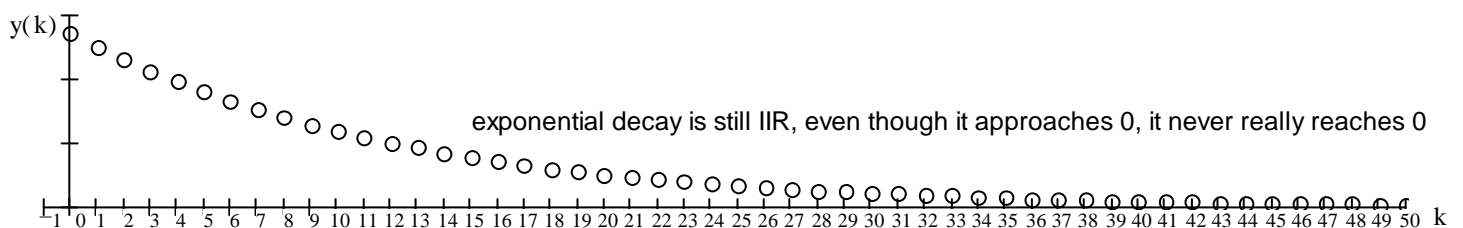

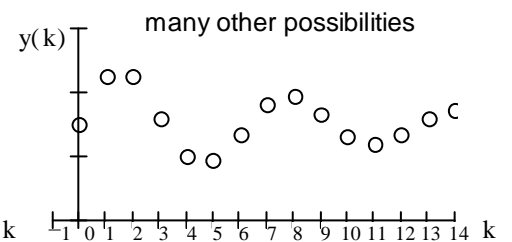

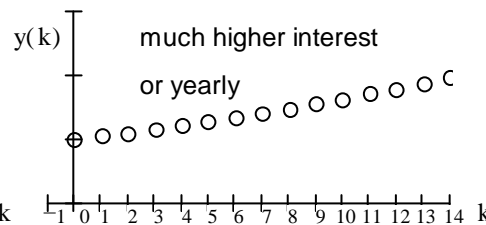

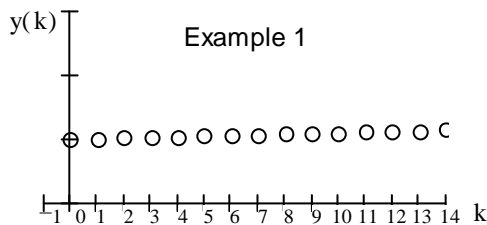

$$Y(z) = 2 \cdot z^{-1} \cdot X(z) + 3 \cdot z^{-2} \cdot X(z) + 2 \cdot z^{-4} \cdot X(z) + z^{-5} \cdot X(z)$$

$$H(z) = \frac{Y(z)}{X(z)} = (2 \cdot z^{-1} + 3 \cdot z^{-2} + 2 \cdot z^{-4} + z^{-5}) \cdot \frac{z^5}{z^5}$$

$$H(z) = \frac{2 \cdot z^4 + 3 \cdot z^3 + 2 \cdot z + 1}{z^5}$$

### IIR (Infinite Impulse Response)

## Bounded-Input, Bounded-Output (BIBO) Stable

A system is considered BIBO stable if the output is bounded for any bounded input.

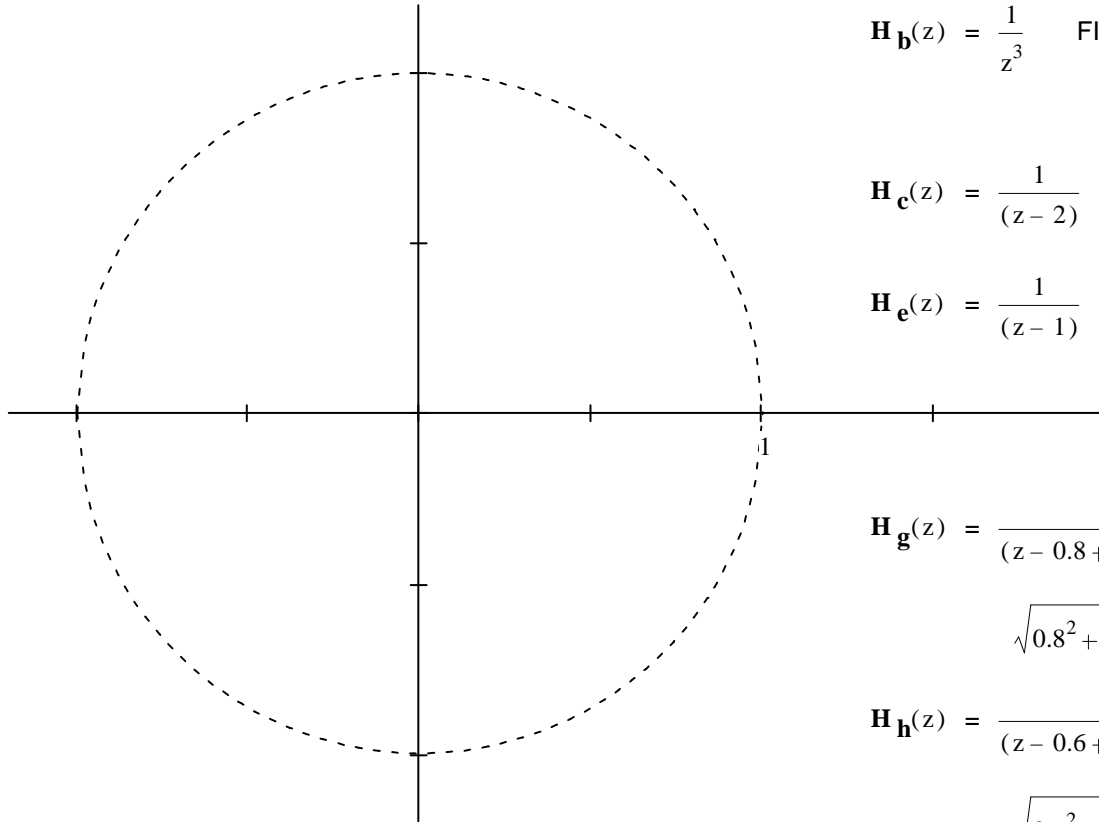

A bounded input could have single poles on the unit circle at any location.

A bounded output may not have double poles on the unit circle or any poles outside the unit circle.

The output will have all the poles of the input plus all the poles of the system. (except in rare pole-zero cancellations.)

Therefore: A BIBO system may not have any poles on the unit circle or outside the unit circle.

Draw the poles on this unit circle

$$\mathbf{H}_a(z) = \frac{1}{z \cdot (z - 0.5)}$$

$$\mathbf{H}_b(z) = \frac{1}{z^3} \quad \text{FIR}$$

$$\mathbf{H}_c(z) = \frac{1}{(z - 2)} \quad \mathbf{H}_d(z) = \frac{1}{(z + 2)}$$

$$\mathbf{H}_e(z) = \frac{1}{(z - 1)} \quad \mathbf{H}_f(z) = \frac{1}{(z + 1)}$$

$$\mathbf{H}_g(z) = \frac{1}{(z - 0.8 + 0.8 \cdot j) \cdot (z - 0.8 - 0.8 \cdot j)}$$

$$\sqrt{0.8^2 + 0.8^2} = 1.131 = |p|$$

$$\mathbf{H}_h(z) = \frac{1}{(z - 0.6 + 0.8 \cdot j) \cdot (z - 0.6 - 0.8 \cdot j)}$$

$$\sqrt{0.6^2 + 0.8^2} = 1 = |p|$$

$$\mathbf{H}_i(z) = \frac{1}{(z - 0.6 + 0.6 \cdot j) \cdot (z - 0.6 - 0.6 \cdot j)}$$

$$\sqrt{0.6^2 + 0.6^2} = 0.849 = |p|$$

a,b, YES poles all inside unit circle

c,d, NO pole outside

e,f, NO right on unit circle

g, NO outside

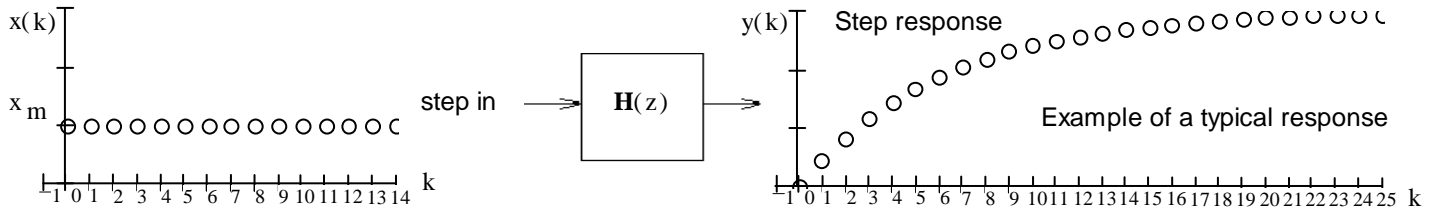

h, NO right on unit circle

i, YES inside unit circle

# Step Response

Remember: Continuous-time (Laplace)  $Y_{ss}(s) = \frac{X_m \cdot H(0)}{s}$   $y_{ss}(t) = X_m \cdot H(0) \cdot u(t)$   $H(0) = \text{DC Gain}$   
 Sooo.. yesterday

Today...

$$X(z) = X_m \cdot u(k)$$

## Steady-State Response & DC Gain For BIBO Systems

$$Y(z) = X(z) \cdot H(z)$$

Complete step response = steady-state response + transient response

partial fraction expansion:  $Y(z) = X_m \cdot \frac{z}{z-1} \cdot H(z) = A + \left[ \frac{B}{(z-p_1)} + \frac{C}{(z-p_2)} + \frac{D}{(z-p_3)} \right]$

divide both sides by  $z$   $\frac{Y(z)}{z} = X_m \cdot \frac{1}{z-1} \cdot H(z) = \frac{A}{z-1} + \left[ \frac{B}{(z-p_1)} + \frac{C}{(z-p_2)} + \frac{D}{(z-p_3)} \right] \cdot \frac{1}{z}$

multiply both sides by  $(z-1)$   $Y(z) \cdot \frac{z-1}{z} = X_m \cdot H(z) = A + \left[ \frac{B}{(z-p_1)} + \frac{C}{(z-p_2)} + \frac{D}{(z-p_3)} \right] \cdot \frac{z-1}{z}$

set  $z=1$   $X_m \cdot H(1) = A$

$$Y(z) = X_m \cdot \frac{z}{z-1} \cdot H(z) = X_m \cdot H(1) \cdot \frac{z}{z-1} + \left[ \frac{B}{(z-p_1)} + \frac{C}{(z-p_2)} + \frac{D}{(z-p_3)} \right]$$

**steady-state response**

**transient response**  
(all other poles are inside unit circle (BIBO))

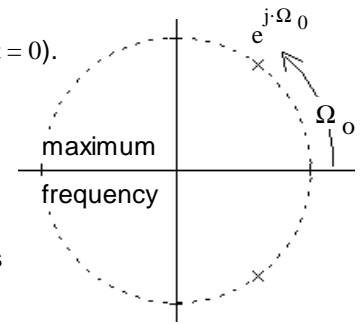

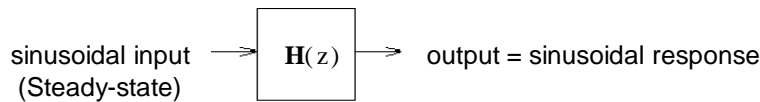

$$y_{ss}(k) = X_m \cdot H(1) \cdot u(k)$$

$H(1) = \text{DC Gain}$

The **transient part** would be found by finishing the partial-fraction expansion.

# Sinusoidal Response For BIBO Systems

The sinusoidal response of a system is the output when the input is a sinusoidal (starting at  $t = 0$ ).

For continuous time, we found  $\mathbf{H}(j\omega) = |\mathbf{H}(j\omega)| \angle \mathbf{H}(j\omega)$  all  $j\omega$  are on the Imaginary axis

For discrete time, we find  $\mathbf{H}(p) = |\mathbf{H}(p)| \angle \mathbf{H}(p)$  where all  $p$  are on the unit circle

That means that  $p = 1 \angle \underline{\Omega}_0 = 1 \cdot e^{j\Omega_0} = e^{j\Omega_0}$

$$\mathbf{H}(e^{j\Omega_0}) = |\mathbf{H}(e^{j\Omega_0})| \angle \mathbf{H}(e^{j\Omega_0})$$

Use in the same way.

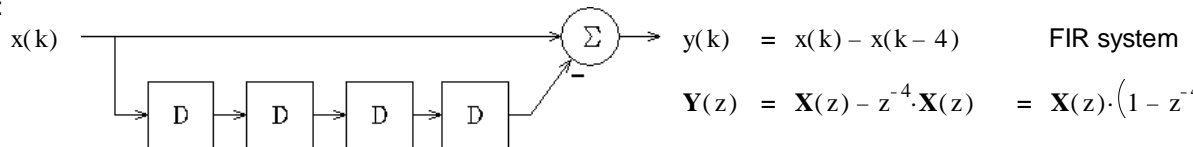

Either:

Modify the magnitude and phase of the input to get the steady-state output,  $y_{ss}(k)$  (multiply magnitudes & add phases)

OR  $\mathbf{Y}(z) = \mathbf{X}(z) \cdot \mathbf{H}(e^{j\Omega_0})$  Which gives both steady-state and transient outputs.

to get a frequency response plot, allow to vary from 0 (or near 0) to the maximum frequency.

Example from text:

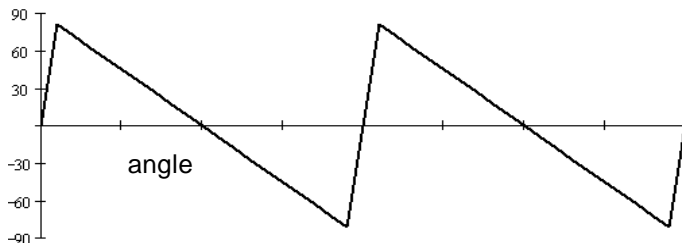

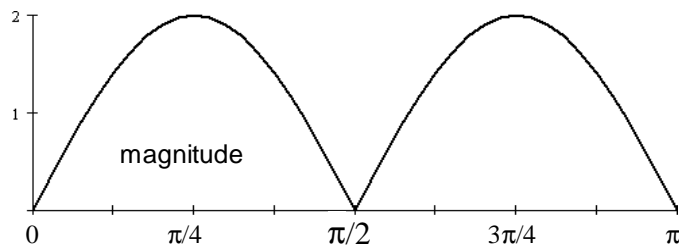

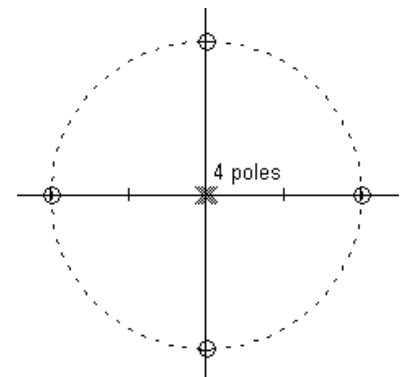

$$\mathbf{Y}(z) = \mathbf{X}(z) - z^{-4} \cdot \mathbf{X}(z) = \mathbf{X}(z) \cdot (1 - z^{-4})$$

$$\begin{aligned} \mathbf{H}(z) &= \frac{\mathbf{Y}(z)}{\mathbf{X}(z)} = 1 - z^{-4} = 1 - \frac{1}{z^4} \\ &= \frac{z^4}{z^4} - \frac{1}{z^4} = \frac{z^4 - 1}{z^4} = \frac{(z^2 + 1) \cdot (z^2 - 1)}{z^4} \end{aligned}$$

$$\mathbf{H}(z) = \frac{z^4 - 1}{z^4}$$

$$\mathbf{H}(e^{j\Omega_0}) = \frac{(e^{j\Omega_0})^4 - 1}{(e^{j\Omega_0})^4} = \frac{e^{j\Omega_0 \cdot 4} - 1}{e^{j\Omega_0 \cdot 4}}$$

These strange, repeating frequency-response curves are common in digital signal processing. Take a class in DSP to learn more. Here, this is about as deep as we're going.

The **transient part** would be found by partial-fraction expansion.

## Initial Conditions

Initial Conditions are handled here much like they are in continuous time, with similar results. In a BIBO system their effects disappear quickly and are very similar to the impulse response.

## Integration

$$y(k) = y(k-1) + x(k) \quad \text{Accumulation}$$

old sum + new

$$Y(z) = z^{-1} \cdot Y(z) + X(z)$$

$$Y(z) - z^{-1} \cdot Y(z) = X(z)$$

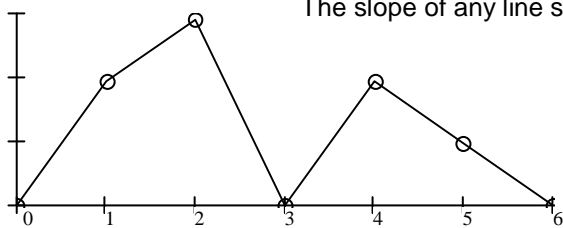

$$Y(z) \cdot (1 - z^{-1}) = X(z)$$

$$H(z) = \frac{Y(z)}{X(z)} = \frac{1}{1 - z^{-1}} = \frac{z}{z - 1}$$

Compare to Laplace, where the transfer function for integration is  $\frac{1}{s}$   
In both cases this is also the transform of the unit step function.

That's because convolution of a signal with the unit step function is the same as integration.

## Differentiation

The slope of any line segment is  $y(k) = \frac{\text{rise}}{\text{run}} = \frac{x(k) - x(k-1)}{1}$

$$Y(z) = X(z) - z^{-1} \cdot X(z)$$

$$Y(z) = X(z) \cdot (1 - z^{-1})$$

$$H(z) = \frac{Y(z)}{X(z)} = 1 - z^{-1} = \frac{z - 1}{z}$$

Compare to Laplace, where the transfer function for integration is  $s$ .

In both cases this is the inverse of transform of integration.

In continuous time, differential equations play a very important role in describing the world.  
In the digital, they become difference equations.

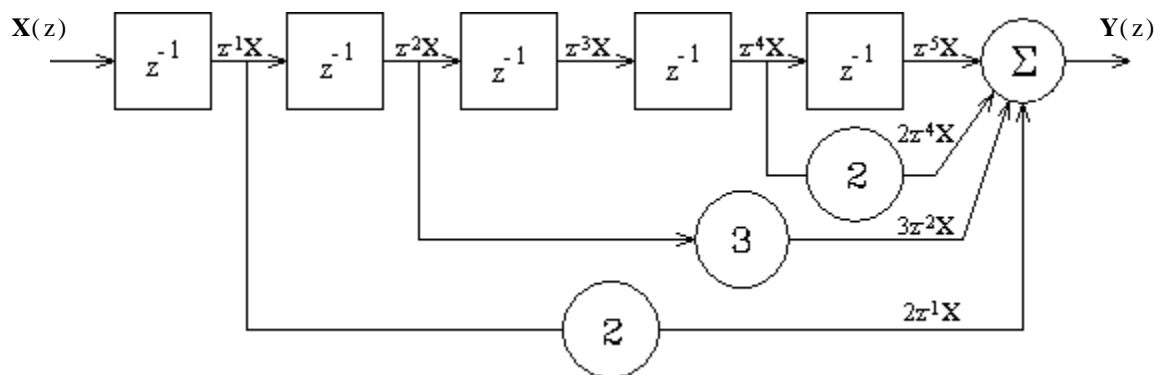

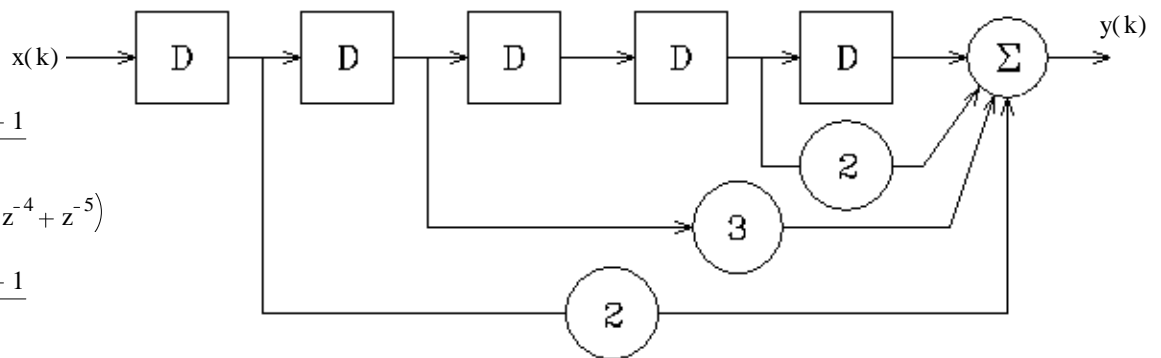

## Implementation

FIR Example:

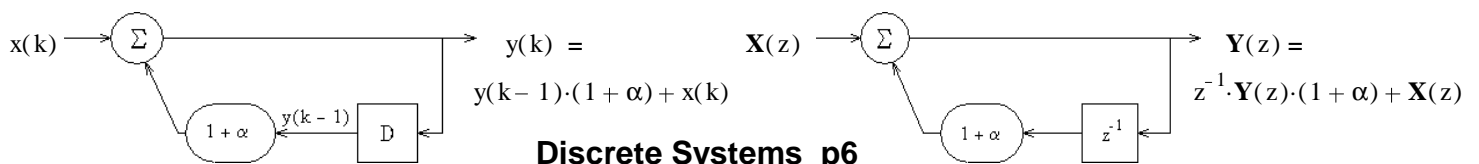

$$H(z) = \frac{2 \cdot z^4 + 3 \cdot z^3 + 2 \cdot z + 1}{z^5}$$

$$= (2 \cdot z^{-1} + 3 \cdot z^{-2} + 2 \cdot z^{-4} + z^{-5})$$

$$= \frac{2 \cdot z^4 + 3 \cdot z^3 + 2 \cdot z + 1}{z^5}$$

IIR The very first example of an interest bearing bank account, go back and look.

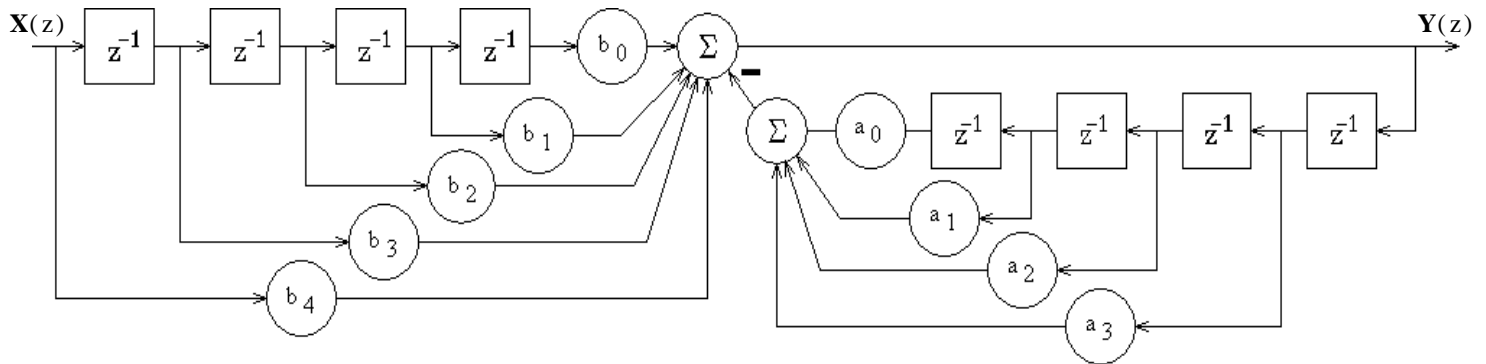

## IIR General Example

$$H(z) = \frac{Y(z)}{X(z)} = \frac{b_4 z^4 + b_3 z^3 + b_2 z^2 + b_1 z + b_0}{z^4 + a_3 z^3 + a_2 z^2 + a_1 z + a_0} = \frac{b_4 + b_3 z^{-1} + b_2 z^{-2} + b_1 z^{-3} + b_0 z^{-4}}{1 + a_3 z^{-1} + a_2 z^{-2} + a_1 z^{-3} + a_0 z^{-4}}$$

$$Y(z) \cdot (1 + a_3 z^{-1} + a_2 z^{-2} + a_1 z^{-3} + a_0 z^{-4}) = X(z) \cdot (b_4 + b_3 z^{-1} + b_2 z^{-2} + b_1 z^{-3} + b_0 z^{-4})$$

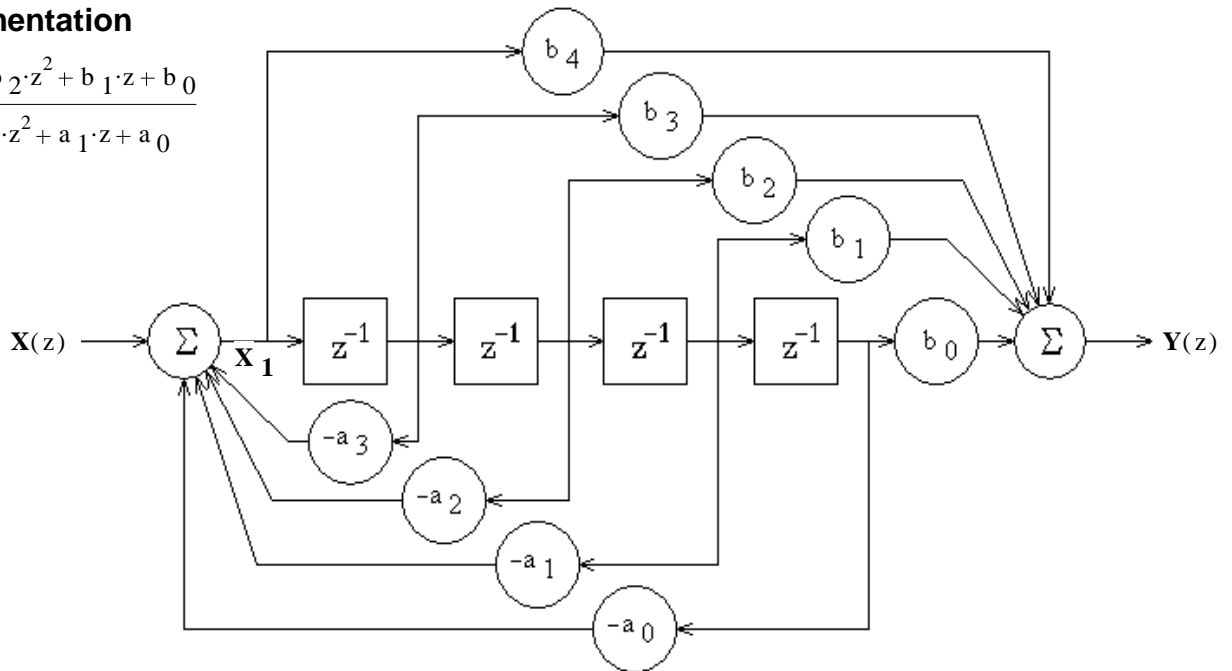

$$Y(z) = X(z) \cdot (b_4 + b_3 z^{-1} + b_2 z^{-2} + b_1 z^{-3} + b_0 z^{-4}) - Y(z) \cdot (a_3 z^{-1} + a_2 z^{-2} + a_1 z^{-3} + a_0 z^{-4})$$

### Direct Implementation

### Minimal Implementation

$$\frac{b_4 z^4 + b_3 z^3 + b_2 z^2 + b_1 z + b_0}{z^4 + a_3 z^3 + a_2 z^2 + a_1 z + a_0}$$

$$X_1 = X(z) - a_3 z^{-1} \cdot X_1 - a_2 z^{-2} \cdot X_1 - a_1 z^{-3} \cdot X_1 - a_0 z^{-4} \cdot X_1$$

$$X_1 \cdot (1 + a_3 z^{-1} + a_2 z^{-2} + a_1 z^{-3} + a_0 z^{-4}) = X(z)$$

$$X_1 = \frac{X}{1 + a_3 z^{-1} + a_2 z^{-2} + a_1 z^{-3} + a_0 z^{-4}}$$

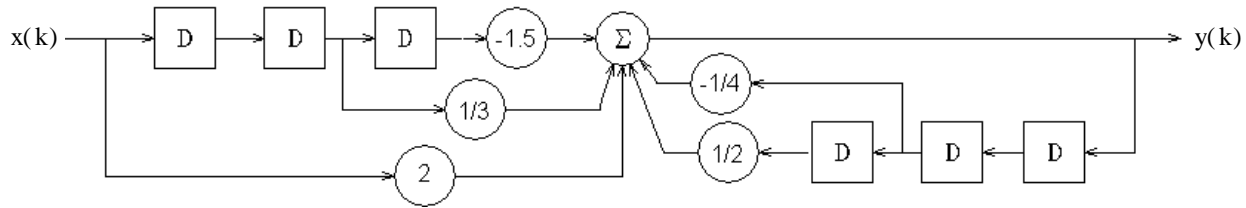

$$Y(z) = X_1 \cdot (b_4 + b_3 z^{-1} + b_2 z^{-2} + b_1 z^{-3} + b_0 z^{-4})$$

$$Y(z) = \frac{X}{1 + a_3 z^{-1} + a_2 z^{-2} + a_1 z^{-3} + a_0 z^{-4}} \cdot (b_4 + b_3 z^{-1} + b_2 z^{-2} + b_1 z^{-3} + b_0 z^{-4})$$

$$H(z) = \frac{Y(z)}{X(z)} = \frac{b_4 + b_3 z^{-1} + b_2 z^{-2} + b_1 z^{-3} + b_0 z^{-4}}{1 + a_3 z^{-1} + a_2 z^{-2} + a_1 z^{-3} + a_0 z^{-4}} \quad \text{Check, it works}$$

Example From Spring 2011 Final a) Draw the block diagram of a simple direct implementation of the difference equation.

$$y(k) = 2 \cdot x(k) + \frac{x(k-2)}{3} - 1.5 \cdot x(k-3) - \frac{1}{4} \cdot y(k-2) + \frac{1}{2} \cdot y(k-3)$$

b) Find the  $H(z)$  corresponding to the difference equation above. Show your work.

$$Y(z) = 2 \cdot X(z) + \frac{1}{3} \cdot X(z) \cdot z^{-2} - 1.5 \cdot X(z) \cdot z^{-3} - \frac{1}{4} \cdot Y(z) \cdot z^{-1} + \frac{1}{2} \cdot Y(z) \cdot z^{-2}$$

$$Y(z) + \frac{1}{4} \cdot Y(z) \cdot z^{-2} - \frac{1}{2} \cdot Y(z) \cdot z^{-3} = 2 \cdot X(z) + \frac{1}{3} \cdot X(z) \cdot z^{-2} - 1.5 \cdot X(z) \cdot z^{-3}$$

$$Y(z) \cdot \left(1 + \frac{1}{4} \cdot z^{-2} - \frac{1}{2} \cdot z^{-3}\right) = X(z) \cdot \left(2 + \frac{1}{3} \cdot z^{-2} - 1.5 \cdot z^{-3}\right)$$

$$H(z) = \frac{Y(z)}{X(z)} = \frac{2 + \frac{1}{3} \cdot z^{-2} - 1.5 \cdot z^{-3}}{1 + \frac{1}{4} \cdot z^{-2} - \frac{1}{2} \cdot z^{-3}} \cdot \left(\frac{z^3}{z^3}\right) = \frac{2 \cdot z^3 + \frac{1}{3} \cdot z - 1.5}{z^3 + \frac{1}{4} \cdot z - \frac{1}{2}}$$

c) List the poles of  $H(z)$ . Indicate multiple poles if there are any.

$$0 = z^3 + \frac{1}{4} \cdot z - \frac{1}{2} \quad \text{solves to} \quad \begin{pmatrix} 0.689 \\ -0.345 + 0.779 \cdot j \\ -0.345 - 0.779 \cdot j \end{pmatrix}$$

Poles at: 0.689  
-0.345 + 0.779j  
-0.345 - 0.779j

d) Is this system BIBO stable? Justify your answer.

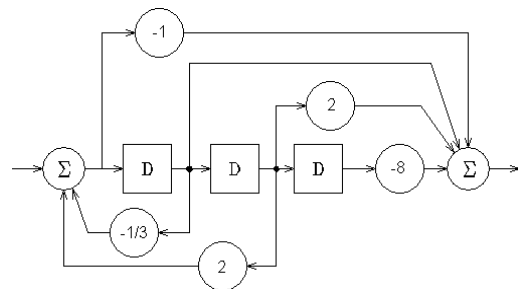

Yes, all poles are inside the unit circle

$$0.689 < 1 \quad \sqrt{0.345^2 + 0.779^2} = 0.852 < 1$$

Another Example from the same Final

Draw a minimal implementation of a system with the following transfer function

$$H(z) = \frac{-z^3 + (z-2) \cdot (z+4)}{z \cdot \left(z^2 + \frac{z}{3} - 2\right)} \quad \text{find} \quad \frac{-z^3 + z^2 + 2 \cdot z - 8}{z^3 + \frac{1}{3} \cdot z^2 - 2 \cdot z}$$

## Continuous Time

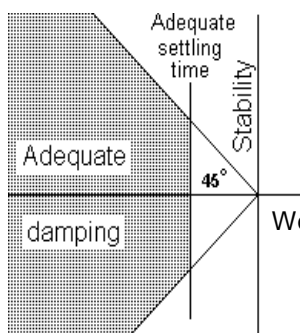

Differential Equations

Laplace Transform

Left-half plane / Right-half plane

Origin

Frequency increases as pole goes up, vertically

## Discrete Time

Difference Equations

z transform

Inside unit circle / outside unit circle

Point at (1,0), the right-most point on unit circle

Frequency increases as pole goes around unit circle

Extra z in numerator of most terms

Divide by z before partial-fraction expansion

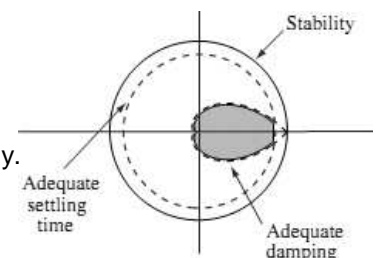

Transfer functions and Block diagrams

Same

Lots of  $z^{-1}$  blocks

Root Locus

Works exactly the same way, but results are interpreted very differently.

1. Like problem 6.4 in the text. Sketch the time function  $x(k)$  that you would associate with the following poles. Only a sketch is required, but be as precise as possible. You may wish to use Matlab or a spreadsheet to plot these.

- a)  $p_1 = 0.3$  and,  $p_2 = 0.9$       b)  $p_1 = 1$ ,  $p_2 = -1$       c)  $p_1 = e^{j\frac{\pi}{6}}$ ,  $p_2 = e^{-j\frac{\pi}{6}}$       d)  $p_1 = 0.9j$ ,  $p_2 = -0.9j$

2. See the back of this page.

3. Problem 6.1 in the Bodson text.

Find  $x(0)$  if the z-transform of  $x(k)$  is:

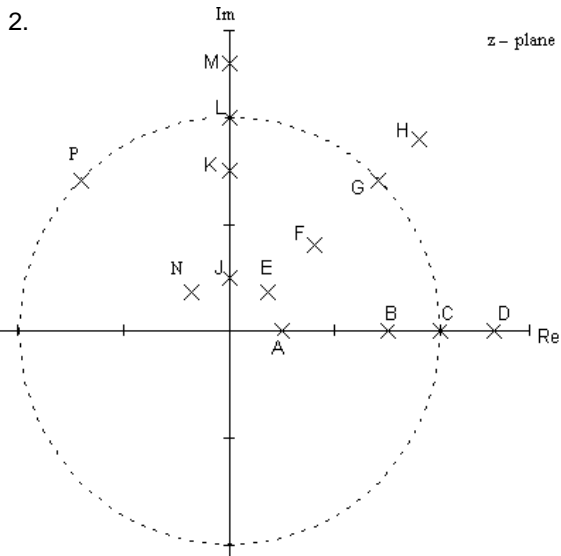

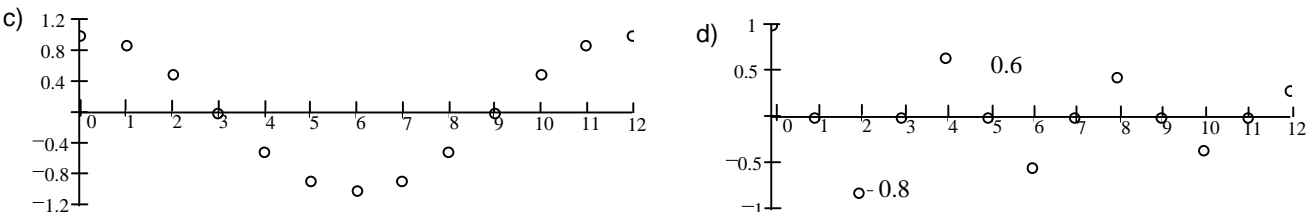

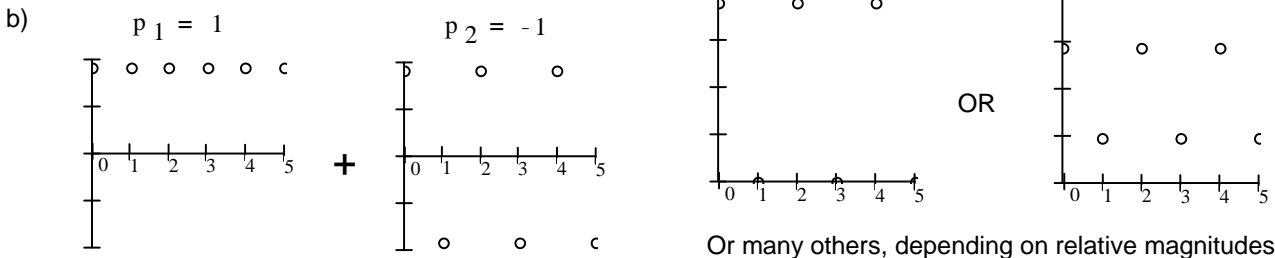

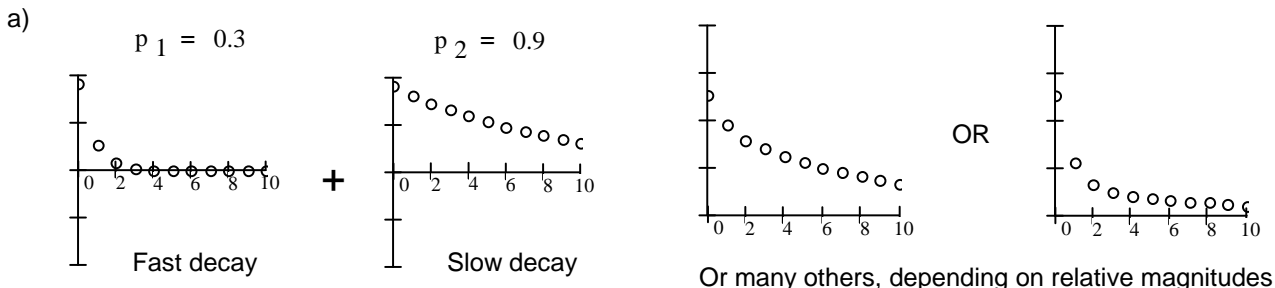

a)  $X(z) = \frac{a \cdot z - 1}{z - 1}$

b)  $X(z) = \frac{z}{z^2 - a \cdot z + a^2}$

4. Problem 6.7 in the text.

**Answers**

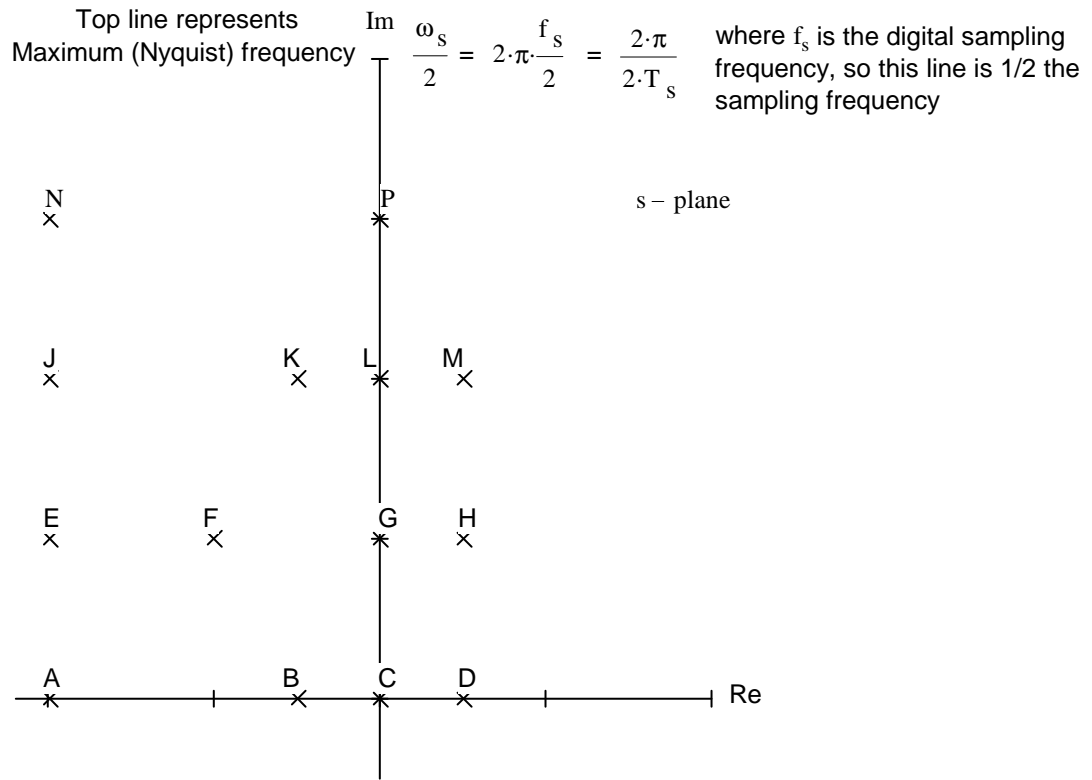

1. Actual signals may have different magnitudes and/or phase angles. You can't tell those things from the pole locations.

3. a) a	b) 0		
4. (6.7)	<u>Bounded</u>	<u>Converges</u>	$x(\infty)$
a)	yes	yes	0
b)	yes	yes	0 vanishes in a finite time (all poles are at zero)
c)	yes	no	
d)	yes	yes	8/9
e)	yes	yes	2
f)	no		
g)	yes	no	
h)	yes	yes	1

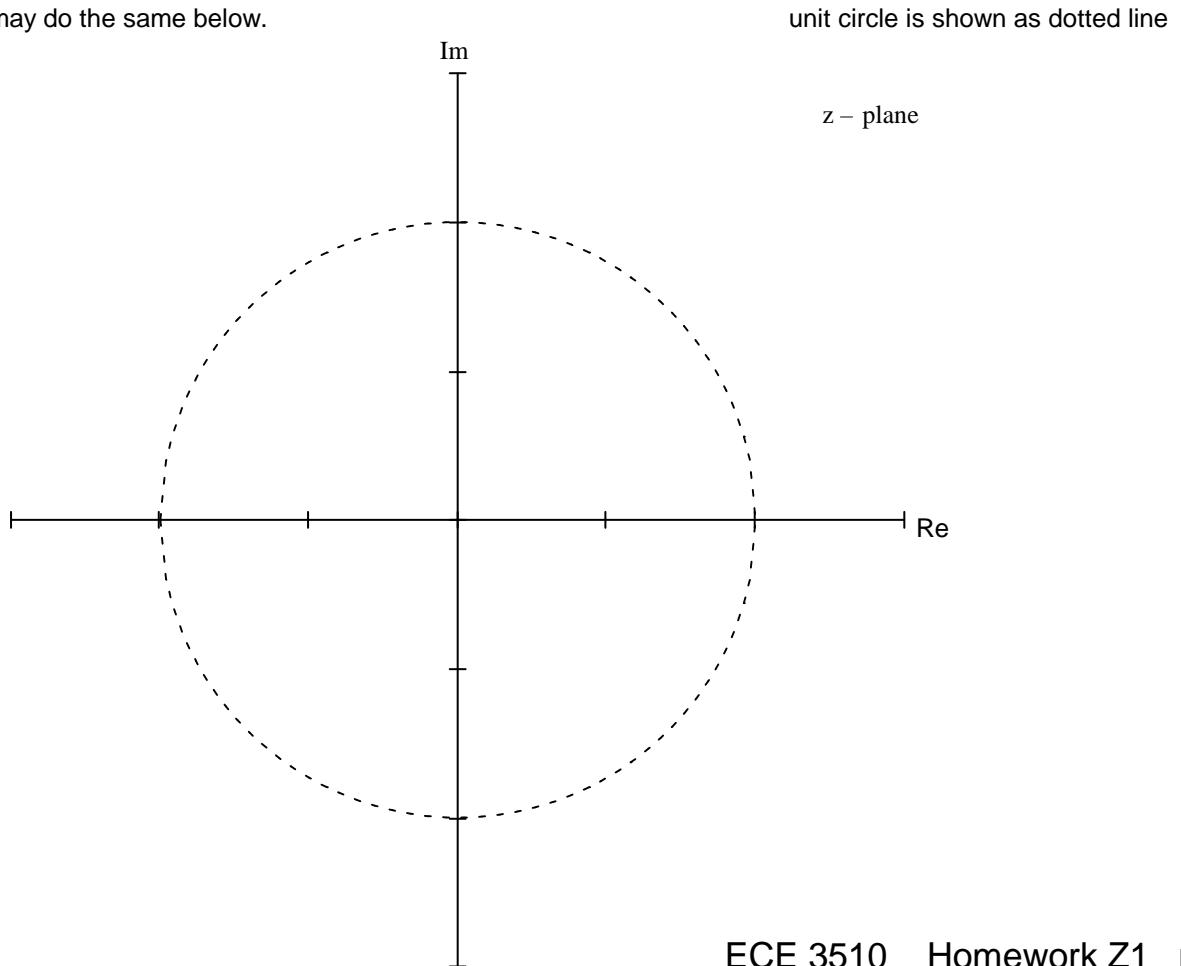

Name: \_\_\_\_\_

2. For each of the pole locations shown on the s-plane below, Draw and label a similar pole location on the z-plane.

Note: The poles on both planes do come in complex-conjugate pairs, but I have only shown those above the real axis.

You may do the same below.

ECE 3510 homework # Z2 Due: Mon, 4/24/23

1. Problem 6.3 in the text. Use partial fraction expansions to find the  $x(k)$  whose z-transform is

a)  $X(z) = \frac{1}{(z-1)(z-2)}$       b)  $X(z) = \frac{z}{z^2 - 2z + 2}$

2. Problem 6.6 in the Bodson text.

3. a) Use partial fraction expansion to find  $x(k)$  for the following z-transforms:  $X(z) = \frac{z^2}{(z+1)(z^2 - 1.4z + 0.98)}$

b) Is the signal represented by part a) bounded? Does it converge? If yes, to what value?

4. Problem 6.8 in the text

homework # Z3 Due: Tue, 4/25/23 or with Final Exam

1. Problem 6.9 in the Bodson text.

2. Problem 6.10 in the text

3. Problem 6.11a) only (NOT b) or c)) in the text.

4. a) Draw the block diagram of a simple direct implementation of the difference equation.

$$y(k) = 3 \cdot x(k) + 2 \cdot x(k-1) - x(k-3) - \frac{1}{3} \cdot y(k-1) + \frac{1}{4} \cdot y(k-2)$$

b) Find the  $H(z)$  corresponding to the difference equation above. Show your work.

c) List the poles of  $H(z)$ . Indicate multiple poles if there are any.

d) Is this system BIBO stable? Yes No How do you know?

e) Is this an FIR system? Yes No If not, which terms in the difference equation are to blame?

**Z2 Answers**

1. a)  $\left(\frac{1}{2} \cdot \delta(k) - 1 + \frac{1}{2} \cdot 2^k\right) \cdot u(k)$       b)  $\left[\left(\sqrt{2}\right)^k \cdot \sin\left(\frac{\pi}{4} \cdot k\right)\right] \cdot u(k)$

2. (6.6) a)  $x(k) := -4 \cdot \delta(k) + 2 + 2 \cdot \sqrt{2} \cdot \cos\left(\frac{\pi}{2} \cdot k + \frac{\pi}{4}\right)$

$x(0) = 0$     $x(1) = 0$     $x(2) = 0$     $x(3) = 4$     $x(4) = 4$     $x(5) = 0$     $x(6) = 0$     $x(7) = 4$     $x(8) = 4$

3. a)  $\left[-0.296 \cdot (-1)^k + 0.99^k \cdot \left(0.296 \cdot \cos\left(\frac{\pi}{4} \cdot k\right) + 0.71 \cdot \sin\left(\frac{\pi}{4} \cdot k\right)\right)\right] \cdot u(k)$

b) Yes No N/A

4. (6.8) a) yes      d) yes  
b) yes      e) no  
c) no      f) yes

**Z3 Answers**

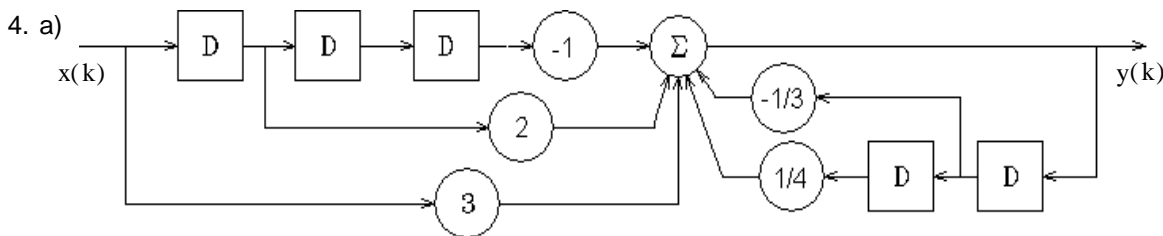

1. (6.9) a)  $H(z) = \frac{z^2}{z^2 - a \cdot z + a^2}$       stable if:  $|a| < 1$

b)  $H(z) = \frac{12 \cdot z^2 + 48 \cdot z - 3}{z \cdot (2 \cdot z - 1)}$       stable

2. (6.10) a)  $H(z) = \frac{z^2}{z^2 - z - 1}$       unstable

b)  $\frac{1 + \sqrt{5}}{2} = 1.618$

3. (6.11) a)  $y_{ss} = -2$

b)  $\frac{3 \cdot z^3 + 2 \cdot z - 1}{z \cdot \left(z^2 + \frac{1}{3} \cdot z - \frac{1}{4}\right)}$

c) 0.036 -0.694

d) YES, All poles are inside the unit circle

e) NO  $-\frac{1}{3} \cdot y(k-1)$  and  $\frac{1}{4} \cdot y(k-2)$
